It's very simple. Many people live quite close to AM stations. If the front
end of the radio doesn't attenuate the AM broadcast band, harmonics of
nearby AM stations will "haunt" the HF bands, and mixing products (difference
frequencies) thereof will _really_ haunt the longwave bands.

Even the best radio is somewhat overwhelmed when the nearest AM station
is coming in at S9 + 150 dB !

1191. Re: FT470 up dates

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-22 17:07:58 UTC
From: frankb@hpsad.HP.COM
Message-ID: <27890002@hpsad.HP.COM>
Source record: 295175

*Note!!!!!!!
*
*Be aware that this effect works on the 2 meter section as well. Since the 2
*meter section is sensitive to a lower frequency range, you might want to
*experiment down there too.
*----------

The 2m section tunes 130-180 already without this fooling around, and it seems that is all the RF hardware is good for. I tried reseting the VHF limits: I recieved the national weather serviecce (162.4 MHz) at 119 MHz. I recieved the 2m band up at 190 MHz. I'm not even sure it can really tune 130-180 properly. I couldn't get any FM broadcast stations, and I couldn't pick up TV 7 sound either (179.75 MHz). From 130 - 136 is aircraft (AM), so it can't demodulate that anyway. I think the VHF limits are 136-174 at best.

The UHF extended recieve is great, I have mine set to 470 MHz. I am going to check out the low end UHF recieve today with a sig gen.

>Thanks

Mike,

I have done a lot of mobile CW. It is kind of like being on a boat -
eventually you just automatically compensate for the swaying of the
vehicle and can send passing CW.

I have done it in quite a few different vehicles, and perhaps the most
important thing to do is to secure the key so it won't slam into the
dashboard if you need to make a sudden stop. It also helps if the key is
not sliding around as you send. It is difficult enough to send while you
are in motion. Some have chosen to drive and op at the same time, but you
are better off as a passenger. Either way, make *sure* that the road is your
primary focus of attention. 'Nuff said.

I have stayed away from the delicate paddles preferred by the high-speed
CW ops. I selected a HamKey paddle because it sure looked rugged. Several
years of use and abuse have borne this out. The only problem I have had
is that the contacts have become somewhat oxidized and have needed some
light sanding and buffing from time to time.

You will have to decide for yourself the best way to set up a CW mobile
station. Safety *must* be the prime concern, both in setup and operating
habits.

Have fun. The CW County Hunters Net is found on 14056(+/- QRM) whenever
a CW mobile is running counties. It will let you hear how other /M ops
are doing it. 73, Ed.

1194. Major Solar Flare Alert - X-Class Event - 22 July

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-22 18:30:31 UTC
From: oler@HG.ULeth.CA
Message-ID: <910722123031.202007e2@HG.ULeth.CA>
Source record: 295169

-- MAJOR SOLAR FLARE ALERT --

JULY 22, 1991

Flare Event Summary
- Low Impact Possible -

MAJOR ENERGETIC EVENT SUMMARY

Another impulsive class X1.0/2B tenflare erupted from Region 6734 today. The event began at 09:46 UT, peaked at 10:03 UT and ended at 10:13 UT on 22 July. This event was associated with a major Type II sweep (importance 3) and an importance 2 Type IV sweep. The Type II occurred at 10:03 UT, coinciding with the maximum x-ray flux. The Type IV occurred at 10:22 UT. This flare was located within Region 6734, at N09E43. A moderate intensity SWF was observed (over high latitudes as well) for approximately 20 to 30 minutes. Moderately high radio emissions were observed with this event. The observed tenflare lasted for 21 minutes. The peak emission occurred at 606 MHz, with a flux of 4,500 sfu. The integrated X-ray flux was observed to be near 0.093 joules per square meter (not particularly high).

Region 6734 is growing in size and is maintaining a potent magnetic configuration (beta-gamma-delta). This region is composed of large, closely packed spots with high field strengths and large magnetic gradients across the region. It appears as though this region (as with Region 6659) may also be utilizing an energy storage-release mechanism. This region was quiet prior to the eruption of this large flare, which is consistent with all of the other events observed from this region to date. Only minor subflares were observed prior to this X-class event.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

At the present time, we believe a low terrestrial impact may materialize from this event. Region 6734 is gradually becoming more threatening as it moves toward the central solar meridian. Central meridian passage will occur on 25 July. There will continue to be a progressively increasing threat for potential proton and PCA activity as this region moves toward and into the western solar hemisphere after 25 July. Protons could be witnessed from future major flares from this region, provided it maintains its present configuration. However, no protons are expected from this last major event.

If Region 6734 continues to behave as it has since rotating into view, another major energetic flare (high-level M-class or low-level X-class) should not be observed until 24 or 25 July. By that time, it will be better placed for producing potential terrestrial impacts. We do not expect any

other major flares from this Region for the next 24 hours, although a risk does exist.

Generally active geomagnetic conditions may materialize if this flare produces a terrestrial impact. Potential terrestrial impacts should not be observed until 24 July. There is a risk for isolated minor storming over the high latitude regions on 24 and possibly 25 July, although the activity is not expected to be very energetic.

Minor M-class flaring may be observed from several other east-limb regions. This, as well as occassional major flaring from Region 6734, will produce moderate to possibly high intensity short wave fades (SWFs) over the sunlit hemisphere. High latitudes should not be significantly affected except possibly during the major flare events.

** End of Alert **

1195. Stock market quotes from FM radio

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-22 18:37:31 UTC
From: mpe@shamash.cdc.com
Message-ID: <35351@shamash.cdc.com>
Source record: 295170

The issue of recieving stock quotations from FM SCA decoding hasn't
been discussed for a long time...

I grabbed the yellow pages and looked up under STOCK_QUOTATION_SYSTEMS the
names of four suppliers of the service in my area. After calling each of
them and asking

"...is this one of those things the person has to use a modem to
dial into some-kind of a database or does this thing of yours
receive the signals remotely..."

one company responded that their signal is broadcasted from the local
radio tower. I called the engineer of the radio station and talked for
a half hour. He said that FNN has a sat dish on the roof and they
mix the signal at 67khz and inject at 20%. He also stated that the data
was broadcasted at 9600 bit per second. He was not able to tell me any of
the encoding or transmission characteristics. I drove down to the
radio station and looked at the station's transmission license. It
stated that they were allowed 19khz of bandwidth on the 67khz carrier (more
than enough to move 9600 hz of baseband data using FSK, PSK, AM, or FM
modulation techniques).

I tuned my SCA reciever to the frequency of interest and connected an
oscilloscope to the output of the SCA board. A very digital pattern
can be viewed. A built an amp to make the correct > 12Volt swing for
RS-232 and connect a display terminal. All I saw was random junk.
Inverting the signal also results in random junk.

Does anyone out there in netland know of the electronics behind the
receiver? It would also help if someone could respond with either
the name of manufacturer, model number, or patend number(s).
mpe@shamash.cdc.com

P.S.
Please refer any responses about legal issues to the appropriate
(non-technical) newsgroup.

1196. AR3000 and computer control

Newsgroup: rec.radio.amateur.misc

From: toppin@melpar.UUCP
Message-ID: <227@melpar.UUCP>
Source record: 295168

I have an ICOM-R7000 at home that I have been using for
a while now in a computer controlled scanning setup.
Recently, at work, I have been able to use an AR3000
and have written some simple software to scan with it
I have found it to be vastly easier to use in computer controlled
scanning than the ICOM.
The difference is so striking that I am considering selling
the ICOM and buying an AR3000 for home use.
I am interested in any others that are running the AR from
a computer and what scan rate they achieve.
I can only get mine up to about 5 tunes per second before
I have character loss problems which then tunes incorrectly.
I am running Xenix and I believe the port tty parameters are
configured incorrectly (rts/cts flow control not working).
If you are familiar with this or are interested please drop
me a line or post.
If anyone is interested in the software I will send it but it
is not sophisticated.

thanks
Doug Toppin

1198. Icom IC-4SAT xtnded transmit mod - how to

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-22 20:37:58 UTC
From: gettys@yacht.enet.dec.com
Message-ID: <24803@shlump.lkg.dec.com>
Source record: 295172

Ok, I recently asked the net for mods to expand the transmit frequency coverage of the Icom IC-4SAT so that I could access the rest (or at least more) of the 440 ham band below 440mhz. Well, the net didn't come through but a local ham made a suggestion to me that I followed up on. I mentioned that I had a mod (see attached message below) for the IC2SAT to expand its transmit range. He suggested that I look at doing the same mod (I know - it sounds crazy). Since I have the tech manual for both units, I lo

oked at the 2S manual to see what the mod was doing. I then looked at the 4S manual to see if things were similiar. To my suprise (although in retrospect I'm not suprised, just suprised that I didn't think of it) the microprocessor section is IDENTICAL with only the initialization matrix of diodes being different between the 2S and the 4S. Even the part numbers of the micro were the same (led me to believe that the code is the same in both). So I tried the mod explained below.

Bottom line - it worked!! I get about 30 mhz of lock range from about 435mhz to 465mhz. My next step will be to look at retuning the vco to move it down in the ham band more.

/s/ Bob Gettys N1BRM

Thanks to David Thomas whose 2SAT mod is attached below for posting it last fall.

From: dt@yenta.alb.nm.us (David B. Thomas)

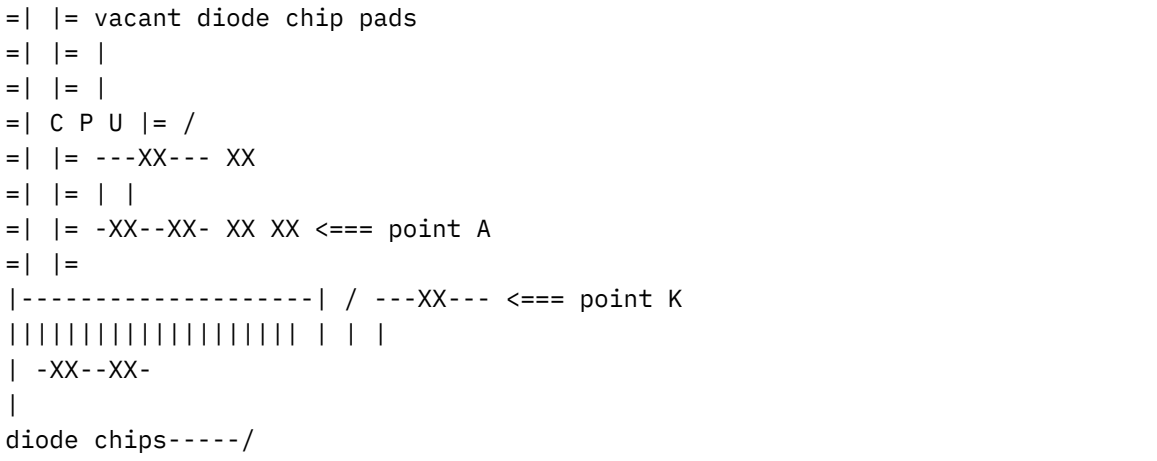
=====
I have just discovered a way to turn off the policeman in the 2sat that stops the transmitter from operating outside of 140-150 Mhz. The only limitation is now transmit VCO lock range, which, out of the box, is about 137 to 162 mc. I'm sure by tuning a slug one could raise or lower this coverage "window".

To do the mod, you'll need a soldering iron with a VERY fine tip, some fine solder, some small screwdrivers, a 1N914 diode (or other small silicon diode), some fine (wire wrap) wire, and (probably) a magnifying glass!

Follow the directions on page 34 of the instruction booklet to take the unit apart. This allows the front panel to be removed from the radio. No further disassembly is required, or recommended. Watch out for the little springy-dingy that locks the battery in place on the radio (the book so cautions).

Looking at the inside of the front panel, you should easily spot the CPU chip. (it is even shown as a square symbol in the picture on page 34.) Just to the right of the bottom right portion of the CPU is a teeny three legged device, exactly to the right of which are three solder terminals where another such device could fit. Here's some ascii art:

```
||||||||||||||||||
|--------------------|
```



The scaling is pretty bad, but it's pretty easy to find the three unused pads, then look left for one diode chip, then down and to the right for the other, as shown.

To implement the mod, it is necessary to install a diode of your own from point A (anode) to point K (cathode) in the diagram above. These points are EXTREMELY close together, and the board is delicate, so I recommend the following:

Take a 1N914 diode and cut the leads to 1/8 inch or less, then solder fine (26 ga. or thinner) wires of different colors to the leads, noting which is the cathode and which is the anode. Now put a piece of heat shrink or tape over the diode so that only the little wires escape. This assembly can now be safely soldered into the circuit, and the unit carefully reassembled.

Reset the CPU (see inside font cover of manual) and you're on the air!

little david

1200. Alinco DJ-160T and Mickey Mouse

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-22 21:42:22 UTC
From: mozer@earth.atmo.arizona.edu
Message-ID: <2935@amethyst.math.arizona.edu>
Source record: 295173

I have owned my ALINCO DJ-160T for about six months and I have been happily satisfied with it. Even after using it for all of these months, I am still discovering the features of this radio (I attribute this mostly to the rotten documentation which I gave up on after the first two pages).

My latest discovery seemed quite humorous at the time. I have always had the Auto Power Off (APO) feature enabled, but it never got the chance to activate because of busy repeaters...until yesturday, that is.

I was hiking along in the mountains when, to my suprise, I started hearing a long forgotten, but familiar little tune. Thinking that I was alone in the forest (except for the grazing bull who was in my path and which I was very quietly trying to pass without his notice) I suddenly stopped and peered over my shoulder to see who (or what) was making this music. I saw nobody around, but the tune ended as quickly as it came. I paused for a moment, worried not so much what the source of the music was as what the blast the tune was. It was one of those tunes that everybody knows, but can't name at a moments notice when pressed.

When I returned my head to the forward position to continue my hike, I was again suprised by the big black bull which had apparently also heard this tune. He must have also recognized the tune and decided he didn't like it because he was no longer grazing but rather he had his head slightly lowered with his beady little eyes aimed directly at me. His seemed to be perfectly inanimate with the exception of his front hoofs which were intently stroking the ground beneath him.

Now I am a confirmed city slicker, but I know enough to assume that this was no sign of affection and I opted to briskly return in the direction from which I came.

When I was safely out of range and had regained my composure, my mind returned to the quere little tune. Investigating further, I noticed that my Alinco had, in fact, turned itself off. "That must be it" I said to myself as I associated the hi-pitched electronic sounding music with the beeps the radio insists on making whenever I push its buttons. I still couldn't quite put my finger on the tune. "Hum hum hum, hum hum hum, hum hum hum hum hum" I repeated in my head several times (the tune was still fresh in my short-term memory even after the recent bull incident).

"Ah Ha!" I exclaimed aloud while simultaneously slapping myself in the forehead with my palm. "M I C...K E Y...M O U S E" "That's what that tune was!"

Well, to make a short story long, two questions remain in my mind:

1) Was the playing of this particular song programed into this radio by some disgruntled engineer who knew something about this radio that I don't know?

2) Are there any other surprises awaiting me with this radio?

The second of these is somewhat of a concern considering that this latest discovery was potentially life threatening ;-)

-joel

>their rig and WX, etc. Pretty slick.
>
A history note. The first version of the QSO simulator was built not a
a computer program but as a stand alone microprocessor. Steve made the
box look like a compact QRP radio with a bandswitch, tuning knob and
even a coax connector on the back for the antenna. If you changed the
bandswitch, it changed the call signs of the stations to resemble the
expected propogation for that time of day. If you turned the tuning
knob, the pitch of the signals changed. It was so good, that more than
one person saw it being demoed and actually believed that he was working
80 meter CW with a 12 inch whip!

Alas, in order to reduce costs, the commercial units copies of Dr DX
have all been software programs without the nifty box.

1202. Yaesu FT470 extnded RX sensitivity

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-23 01:09:26 UTC
From: frankb@hpsad.HP.COM
Message-ID: <27890003@hpsad.HP.COM>
Source record: 295177

I measured the sensitivity of my Yaesu FT-470 over frequency to see how well it holds up outside of the ham bands. I wanted to see how useful the extended receive info being handed out really was.

The measurement is a relative one. I was using an HP8657 Signal Generator, with the internal FM modulation set to 5 KHz deviation and a 400 Hz tone. I input a signal with an amplitude of -100 dBm directly into the RF input of the radio. I noted the reading on the signal strength meter in the Yaesu. On the VHF band the number nine was on steadily, on the UHF band the number nine was blinking. As I changed frequencies I adjusted the amplitude of the signal generator to keep the signal strength meter on the Yaesu at the same level. The amount I had to crank up the output of the signal generator is the reduced sensitivity, here is the data:

VHF:
freq: relative sensitivity:
136 -14 dB
140 -3 dB
144 +1 dB
146 0 dB reference point
148 -1 dB
155 -6 dB
160 -22 dB
165 -29 dB
170 -38 dB
174 -44 dB

UHF:
freq: relative sensitivity:
400 no reading, nothing, -infinity dB
401 -40 dB
402 -38 dB
405 -34 dB
410 -27 dB
420 -9 dB
430 +1 dB
440 0 dB
450 0 dB
460 -17 dB
470 -26 dB

conclusions: the radio is good outside the ham bands, but the sensitivity really starts to suffer. I hear the local police at 460.375 quite well, so -17 dB is still usable, but not a good as a scanner would probably be. VHF down to 100 MHz or UHF down to 400 MHz is a fantasy. As I mentioned

in another post, if the frequency ranges are extended too far, you start picking up signals at the wrong frequencies: National weather service (162.4) received at 119 MHz, coast guard channel 12 (156.8) received at 200 MHz, 2 meter repeaters received around 190 MHz and again around 182 MHz. Its hard to say just what the usable ranges are, but something like 136-165 MHz in VHF and 410-470 MHz in UHF, and even then its not great at the ends of these ranges. Thank you to the people who posted the procedures for extending the frequency ranges, I can definitely use the 450-465 range, and the 420-430 range should be useful also.

1203. Potential Geomagnetic Storm Warning Issued - 23 July

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-23 01:31:42 UTC
From: oler@HG.ULeth.CA
Message-ID: <910722193142.2020075c@HG.ULeth.CA>
Source record: 294978

/\

POTENTIAL GEOMAGNETIC STORM WARNING

ISSUED: 01:00 UT, 23 JULY

/\

ATTENTION:

Recent evidence suggests that the major class X1.0/2B tenflare of 22 July may have a low to moderate terrestrial impact (as opposed to just low). There is a risk for minor geomagnetic storming on 24 and 25 July. A-indices could surpass 30 on July 24 or 25. We expect the activity to be confined mostly to the high latitude regions, although some minor storming may also be observed over the middle latitude regions. The activity is still not expected to be particularly energetic.

This Potential Geomagnetic Storm Warning is valid for 24 and 25 July. The interplanetary shock could arrive anytime near or after 07:00 UT on 24 July.

High latitude regions can expect generally moderate levels of auroral activity with possible isolated periods of high activity over some regions in the high latitude zone. Auroral activity should remain confined to the high latitudes. A minor amount of equatorward migration may be observed with this activity, although at the present time nothing major is expected (watch for possible updated warnings).

There shouldn't be a very heavy impact on radio communications with this event. High and polar latitudes will experience the worst conditions if an impact materializes from this major flare. These latitudes can expect generally poor propagation conditions late in the UT day of 24 and on 25 July. The lower latitudes (middle to low) can expect generally good to fair propagation conditions with increased levels of fading and distortion during the local evening and early morning hours.

VHF auroral backscatter may be observed over the high and northerly middle latitude regions late on the 24th or on 25 July, although conditions are not expected to be particularly favorable for backscatter at this time. There is a greater possibility for sporadic and localized periods of backscatter than there is for widespread backscatter. Increased levels of auroral sporadic E are expected to accompany this disturbance.

Conditions should begin to return to quieter levels on 26 July. However, please note that Region 6734 is still expected to spawn occassional major flares as it transits the solar disk. The next major flare (if recent

patterns are reliable) may occur on 24 or 25 July. If a major flare occurs as expected, there will be a higher probability for moderate to possibly high terrestrial impacts over the coming weekend (26 through 28 July).

There is a moderate threat for a major geomagnetic and auroral storm this coming weekend or next week, dependent on the timing and character of the solar activity. Watch for future warnings and/or alerts. The most recent data and 72-hour forecasts for potential geophysical activity are available to registered users on the STD BBS at: (403) 756-3008. In the near-future, we plan on providing computer-generated solar images (full-disk) showing the locations of the solar active regions as well as prognostic images. Actual images of solar flares or other items of interest may also appear on this system for registered users in the future. A public notice will be posted when these new services become available.

Watch for possible future alerts and/or updated warnings.

I purchased what appears to be an antenna from a Motorola cellular phone at a hamfest recently. I want to adapt this antenna to BNC. The connector in question is recessed into the base and looks like a VERY small female F connector. Someone said it looked like an SMA socket, so I bought a male SMA to male BNC adapter. The SMA side wont go together. The antenna has a little offset from the threads that wont let it mate to the adapter. Surely this is reasonably common?

I'm lost. I don't have a lot of experience with this type of connector. I was thinking maybe SMB or something.....?

Please respond directly to me. Thanks in advance.

Sending mail to the USSR can be an adventure, especially to far
out places like Georgia. Every letter from a foreign country
will be inspected with great care from some of the post office
personel. If there is even a slight chance, that there is
something valuable in the envelope, it will be opened. The
"valuable something" will be removed and if you're lucky,
the rest will be delivered to the adressee.. if not, ...

Three advices from my Russian friends:

1) Don't send green stamps, send IRCs.

2) Never mention a callsign on the envelope. Make it look like
a personal letter (same reason).

3) Send it registered mai|.

I cannot help you with that particular station, but maybe your
mail never arrived?

I have an old Collins KWM2A transciever set up for non-amateur frequencies
on both banks of crystals.
To go out and buy the complete set of new crystals would be expensive and
make the radio not worth upgrading.
If there is someone out there in Net-Land who has the amateur crystal set
for sale at a resonable price I would like very much to hear from you.
Thanks,

Is there any truth to the story that
Radio Shack will introduce a 2-meter
handie-talkie in their 1992 catalog?
If so, what does it portend for possible
misuse of the amateur bands by unlicensed
operators? I have heard that in some areas
the easy accessibility of marine-band
radios has lead to CB-type mobile operation
by unlicensed operators.

Ben's advice is probably good advice. I have had about 10 or 11 years experience corresponding with a ham in Siberia. Over the years we have exchanged letters and pictures and he gets the newsletter from my local ham radio club (I pay his dues every year as an associated member). Most of the mail gets through, but not all. I received a letter from him a little over a month ago and he said he sent pictures two weeks before that, but I have not received them. However, for the most part, there is no problem.

I sent him copies of six articles on antennas that were published in Ham Radio a few years ago and he received them. I mailed him a club cap I bought for him last month and will be interested in finding out if he receives it.

However, I have been very curious about so many Soviet hams now wanting to QSL direct rather than through the bureau. I have only QSLed to one direct with a green stamp as he was in one of the republics I don't have confirmed. I have not received a card and doubt if I will. I still QSL almost all of my Soviet contacts via the bureau.

I can recommend corresponding with Soviet hams. It can be very interesting to do so. My friend lives in Irkutsk near Lake Baikal, deepest lake in the world, containing 80% of the fresh water in the USSR and 20% of the fresh water in the world. His last letter gave an insight to the severe economic and food problems. He is going to have to start growing vegetables. His factory (he is an electronic and electrical engineer) gave garden plots to 700 of their employees. However, they are 30 km from Irkutsk, are fully forested and the water level is 100 M (thats right; meters not feet) below the surface. After clearing the forest they have to build roads and dig wells. Makes you realize that most of us don't have it too bad.

I started the correspondence based on advice from ham in Texas who told me of his experience in corresponding with Soviet hams and sending them American items, such as blue jeans, etc. I just picked a QSL card from my pile and wrote the first letter. I got a nice letter in response with a picture of Nick's ham shack, himself and wife and two sons. I am very glad I started doing it. Try it, you might like it.

I have a thought about this. Having just gotten (and then upgraded) my license, I KNOW that a bunch of ham radio dealers get the data so that they can send catalogs to new people and new upgrades. Perhaps somebody has a friend at HRO or AES who could get a copy of the tape donated.

Since they have it anyway, they might see it as a chance to make some friends, and they have already paid for it and gotten all they expect out of it.

>2) some people advocate practicing random QSO's so that you get used to hearing
>the common words in a qso... this sounds like a pretty good idea, but it
>requires a moderately sophisticated computer program in order to practice it
>routinely.

I just upgraded and used this method. I used a combination of the AARL tapes
and the "Super Morse" program for the PC. I found that I did better listening
to tapes than to the computer although I don't know why. I found that about
20 minutes per night was good for me...

Also, it is VERY important to remember that you are allowed to "post-process"
your copy even after they give you the questions. I found that using the
questions to fill in helps a lot. With the execption of call signs and
signal reports the English language is very redundant, so getting half the
letters if often enough to fill in the rest.

Good luck

Bret

>The UHF extended recieve is great, I have mine set to 470 MHz. I am going
>to check out the low end UHF recieve today with a sig gen.

I noticed that quirk with our local WX channel also.

An interesting feature of the UHF mod is that I can now receive cellular transmissions! Try scanning between roughly 456-470 MHz. It only works if I am very close to a cell transmitter, and then it doesn't seem to matter if I have an antenna connected or not. I think what is happening is the signal enters the radio just before the 1st mixer, mixing with the second harmonic of the local oscillator to produce an output at the first IF of 45.1 MHz. Give it a try - but only if there is no law against doing so in your particular country ;-).

I wonder if that's why Yaesu wrote extended UHF receive out of the software?

Radio Shack has offered a cheap 10 meter rig for a few years now and
I don't really notice that this has caused much if any misuse of the 10
meter band. An unlicensed operator who really wants to get on 2 meters
can get a rig mail order through one of the mail order houses anyway without
having to show proof of license. (Sometime in the last year, someone mentioned
that the sales clerks will sometimes ask to see a license before they will
sell the 10 meter rig. Can anyone confirm this, please?)

If RS does come out with an HT, I'll seriously consider buying one. Knowing
RS it will probably be rather chintzy, no-frills, cheap and perfectly
functional rig that would be more than adequate for my needs.

Okay gang. Time once again for "Educate the Neophyte".

I thought that "green stamp" was a euphemism for a dollar bill, and that
an "IRC" was the same as a green stamp. Now I'm confused. What's the
real meaning of "green stamp" and "IRC"? When should one or the other
be used? Where can you get them? How do you redeem them?

Yes, it's true. I know a local salesman (a ham) who got a shipment of little carboard price tags in a couple of weeks ago. There was a price tag for the 2m HT in the shipment. I think it was priced around $270. They will be carrying the Standard HT, similar or identical to the one Heath used to carry before they got out of the ham business.

I don't think things will change all that much. It might even be easier now for a non-ham to mail-order a handy-talkie than it will be to purchase one at Radio Shack. I don't know if they ask to see a ham license or not; I didn't think to ask my salesman friend. Maybe someone else out there knows.

I *love* my TenTec Argonaut. There were a couple of versions of it. The one I have is pretty old (like late '70s/early '80s?) and it runs 2 watts out on 80, 40, 20, 15, and 10 mtrs. I think there was a later model, but I doubt there was one that included the WARC bands. You can pick up a used Argonaut, although it's a rather popular piece of gear--maybe $250 or so.

There's also a Heath rig--HW-7 or some such. Not sure about age, performance, availability.

TenTec is planning to introduce a new Argonaut-like rig, i.e. QRP output, but with a fine receiver, general coverage, etc. But it will be *expensive*, i.e. > $1000.

Sounds like a great idea. In addition to the NYC taxicabs bootlegging
on 10 meters, we can have drug deals going down on 2 meter FM now that
some states are taking a hard look at teenage dealers and pagers.

Whatever sells, I guess...

Judging from your adressyour greatest enemy is yourself!
CW proficiency is inverse proportional to the I.Q. of the
person learning the code.
However with discipline and hard work you may be able to suppress
your urge to use it and be able not only to rich 20 wpm but any
level you may wish.
Formula is very simple...practice....practice....and ....
You should mix random code with plain but in the begining
stay with random and when you rich lets say 25 wpm start more
with plain.It is like piano lessens if you still remember them?
Dont force it if you miss more then 20% you are not learning.
You may try to listen to high speed code like 30 or 40 wpm
but you intentionaly copy only every second caracter, it is a good
way to train your brain to do what you want him to do and not oposite.
It is imperativ to practice regulary like 15 min./day is more advan-
tageous than 30 min. every second day.
You should not have any problem writing it down providing that
you maintain the leg of 2 to 3 letters according to the speed,
at 30 wpm the leg is 5 letters.
Best stations for practice are news AP, UP, Rauter etc. and
commercial, maritaim, wether and different ambassies.

Good luck
from the log of AA6AD (45 wpm and I.Q. of 12)

>Even the best radio is somewhat overwhelmed when the nearest AM station
>is coming in at S9 + 150 dB !

Well, it seems that I'm not the only one who made the mod on my rig. It's
just like I wrote in my original reply: all or most Kenwood rigs use the same
bandpass filter design and the same method of using resistors in series with
the inductors to add 20db of attenuation on the BCB......However, I live two
miles from a station running 5kw on 1150 with a directional antenna and am
having no adverse reactions to their signal. When listening right on 1150kHz
their signal strength is S9+60! Furthermore, I can still listen to a station
on 1160kHz running 250 watts at a distance of 40 miles away with some splatter
but not that much especially when I use notch and slope tune. Sorry folks, I
just don't buy the front end overload business!! Perhaps if I lived right
next to a 50kw station.......
My problem is that I'm receiving too many stations, especially in the local
and regional parts of the band. There are stations on top of stations on
the same frequency that I never heard of before! Lastly, I have never heard
KDKA before until I made the mod, let alone receiving them at S9!!
Again, no problems here! The mod works great! I plan to post the entire mod
for the TS-850S in step by step form on news soon.

Source record: 294999

My FT-470 has three distinct tunes for the APO; one each for 10, 20, and 30 minutes of inactivity. A children's tune (the one in the manual) is used for 10 minutes, "Twinkle, Twinkle" for 20, and a christmas tune for 30 minutes (can't remember the name of the tune. It's not a carol, but one of those tunes played by an orchestra with a choir. It was used in Die Hard, which is what I'm reminded of every time it goes off).

>do to about 40-50 wpm).
>

Well Brad, your first major mistake was mentioning the C-Word here on
the net :-). I pity your poor mailbox :-)

All kidding aside, I'll relate what worked for me:

(Please note all standard disclaimers, your milage may vary)

1. Do as many live qso's as you can - any speed. The monotonity is
what's important. Get familiar with the "standard" exchange. Funny,
but most of the tests I've taken don't use the standard exchange :-).

2. Concentrate your practice on _Sending_ code. I find that too many
people are hung up on receiving the code. Most practice receiving
because that's how they'll be tested. I'm convinced that sending
practice is much more effective, faster and less stressful than
receiving practice. The same part of the brain is used to send as is
to receive. The mental associative process works just as well when
starting with either half of the problem. Letter to code or code
to letter, it's the same translation table.

It's funny to note that a majority of folks I've talked to, including
myself, claim that they can send faster than they can receive. So why
not exploit this obvious advantage? If you can send at 25 words a
minute, you'll be a lot closer to receiving it than you think.

Use an electronic keyer to for your sending practice. There's no need
at this time to develop your straight key (fist) skills. Set yourself
a practice schedule and stick to it. Once or twice a day, at a time
when you can be alone, take a full text page from QST and send every
word of it on the keyer. Key it a panic speed - which is just as
fast as you possibly can. Never mind that it would be to fast for
you to copy, you don't care. This is _Sending_ practice.

When you make a mistake, go back and re-key the word. Most people can
send fast code in short bursts. As soon as you can send it fast in
long bursts, or better yet, continuously, your'e ready for the test.

You should notice daily improvements on your sending speed.
Unwittingly, you have also improved your receiving skills. Take a
short listen to your favorite test source to convince yourself.

General tips:

+ Get used to skipping an occasional letter or two.
Even a lot of letters. Can rou stilx re d ths ?
Remember, only about one in 6 words will be on the exam.

+ Listen closely for the INFORMATION in the test qso.
For example, when your hear ..MY..NAME..IS..JOHN.. being
sent, pay particular attention to the JOHN part of it.
Sounds almost too simple but it's really fundamental.

+ Be fully prepared to take the test more than once.
This helps you to break the "edge" on your nerves.

+ If you must practice receiving, never, ever, practice
at a speed which is lower than your target speed. You're
just wasting your time by trying to attain that which is
of no use to you.

By the way, I was no cw-natural type of person. I slaved and struggled
over 13 wpm, by working my way up from 5 using the successively-faster-
tape technique. The 10 wpm hover lasted _forever_. Then I got a keyer
- the old heathkit paddle jobbie in the green perf box. I picked up
about 1 wpm per day using this thing and was only disappointed by the
fact that I hadn't tried the _Sending_ method earlier.

Good luck on the test...

The Buckmaster CD ROM DOES have a standard format file on it, it's used mostly
by BBS QTH servers, but it's fixed 129 byte records in ascii in call order.
Look in /ham0 for hamcall.129. The dir is hidden on some releases, and the
file may also be hidden, but it's there. Also, unlike the FCC tapes, this
database includes the club calls. Buckmaster imposes some restrictions on use
of the data, since maintaining it is a pain, club calls in particular, and he
gets more for his label printing service by far than he does from the CD-ROM.
He gets monthly updates from the FCC. If he finds himself competeing with his
own database, it'll vanish from the disk, so if you use it, don't abuse it!

BTW, the WA4ONG BBS QTH server always has the latest database, now. Updated
monthly by DAT tape! I know the dates it return are stale, I just haven't had
the time to recompile the code and make those fields configurable!

1232. Motorola micor radio RF out transistor caution

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-24 02:48:22 UTC
From: wa2ise@cbnewsb.cb.att.com
Message-ID: <1991Jul24.024822.23314@cbfsb.att.com>
Source record: 295001

copied from packet:
Msg# TSF Size #Rd Date Time From MsgID To
3969 BN 5 0 11-Jul 1804 WA5VMS 29711_KA5BML INFO@USA (NONE)
Sb: Motorola MICOR PA Warning

I ran into a situation a couple of days ago with a VHF Micor that I had just received from C.W. Wolfe. Someone had attempted to repair the PA stage and had replaced the PA transistors with a Motorola C&E part number M1133. Obviously, the person did not realize that the VHF Micor radios use PNP RF transistors in the final rather than NPN like most other radios. The M1133 is a NPN and the person blew about 60 dollars worth of transistors. For the record, this is the only radio received in this area out of the 20 or so ordered from Wolfe that had any major problems. I have seen a lot worse from other vendors. As a point of information, the radio did make about 12 watts of RF, the shorted PA transistors allowed the driver stage to feed through to the antenna. The moral to this story is, if you replace the PA transistors in a Micor, use only the Motorola C&E part or the following Motorola "generic" parts.

Transistor C&E Part # Generic
M9622 48-869622 2N6094
M9623 48-869623 2N6095
M9624 48-869624 2N6096
M9625 48-869625 2N6097

Good luck with the Micors. If you need further info, contact me on the TexNet PMS at MKOTST or WB5AOH-9 BBS (WB5.OK.USA). The PMS is read by me every day or so and the BBS maybe once a week.

Hey, this brings a whole new slant to VHF foxhunting. If any neighborhood vigilante groups happens to know a Ham, then the local Radio club could track down those drug dealers and "administer justice"

(Sorry for the cynicism, but its been a crummy day!!)

Yeah, this is the same morse machine that Gordon West (WB6NOA) uses to make
his "Radio School," code practice tapes. He places the microphone next
to the unit when he records the tapes, and so with the acoustic coupling
you can occasionally hear airplanes fly over his house and trucks drive
by when you play them back. It's not really quite the quality you'd
expect for the bucks you dish out for the recordings. But, you
could say it's realistic QRM I guess...

1236. 144/220 MHz dual band HT's

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-24 09:03:38 UTC
From: jweiss@casbah.acns.nwu.edu
Message-ID: <1991Jul24.090338.12470@casbah.acns.nwu.edu>
Source record: 295008

A thousand pardons if you see this posting twice, I think I messed up something on the first attempt. The posting software here makes me feel like a Novice again.

I'm considering buying a dual band (144/220) HT. I'm lucky enough to have an XYL with a novice ticket, but who refuses to study for the tech license. She (we) have a ic-3sat that I occasionally use to talk with her via some local 144/220 crossed-linked machines, but I would like talk to her directly.

I know Standard makes such a beast (C228a), but I hesitate to buy from a company whose track record is unknown. I would have perfered to buy another ICOM unit and simplify things as far as options, chargers, mikes etc, but alas 220 isn't the hottest band around and isn't likely to get much more attention with nocode techs and the loss of 2Mhz.

Does anyone know of any new products coming down the line in the next couple months? I really hate buying something, only to have someone else come out a few days later.

Does anyone have any experience with the Standard line? I believe some Heathkit HT's were actually made by Standard. What are the prospects for getting things like larger than normal capacity batteries and the like for these things, especially with Heathkit dropping the ham stuff. Are these unit's any good, do they hold up?

Thanks for any info or comments.

From: rutgers@cst.prl.philips.nl
Message-ID: <rutgers.680355825@cstw32>
Source record: 295009

Dr OM's,
In the last weeks I experimented with a SRA-1-H DBM (double balanced mixer)
followed by a P8002-grounded gate circuit as a post mixer amplifier.
The results are excellent: the dynamic range became 110 dB which was expecyed
'best case'.
BUT, if I examin the designs of professional SW-radio's from R und S or Collins, really the
hot stuff!!, then I always find a diplexer between the DBM and the
next amplifier.
If the post mixer amplifier serves a 50-Ohm load over a wide frequency range,
and the P8002 does, then I see no need for this compexity.
This is supported by my excellent results.
Does anybody KNOW why the professionals do so?
Please no assumptions!

Everyone is rightly worried about the possibility of hords of unlicensed yahoos flooding the repeaters. The answer to this problem, as well as to many of societies ills, is the concept of personal accountability. The government should hold the venders partially liable for crimes committed with them. After the first few judgements against Tandy, you can bet they'd start asking to see licenses before selling the gear.

From time to time there are discussions here regarding using a scanner to pick up cordless phones, baby monitors, and such.

But, has anybody tried to capture those new wireless TV units that let you send a signal from one part of a house to another? I believe these are around 900 mHz or so; are there several channels, like on cordless phones? What are the actual frequencies these are supposed to operate on?
With a good antenna, such as a 5- to 10-element Yagi, what might be the effective range in a suburban area (probably best rated in "houses")?

(Looking for new frontiers in scanning)

QRP Rigs

The older Heath HW-7 etc. were single conversion which means you get both images on every signal. This makes the band look twice as crowded as it is. I think the newest HW-9 ? now has double conversion. I really like the concept of the no nonsense rig. Somewhere I have a copy of an article that gives a list of mods to make the HW-9 "flawless". There were aparently a few minor bugs in it (I would have to look it up).

My current rig is a Kenwood 130S and there is a 130V version which is a QRP power level. Otherwise they are the same. In my book a QRP is a basic rig with "classic" architecture. The 130 is a very good rig but it is heavy and a little larger than the Heath or Argonaut. The point here is that there are two kinds of QRP. The 130V is "legally" a QRP rig but in my mind a QRP rig is something simple and basic....not just low power. I have turned my 130S down to 5W and easily made contacts on 75M at 300 to 500 miles. But this is a digital radio with a synthesized VFO. You don't take the cover off of this radio and play with the VFO. It is a radio SYSTEM in the 1980's sense of the word.

Anyhow my point here is that TO ME: QRP is is a SIMPLE radio that you can throw around and experiment with and know every part in it. So my vote is with radios like the Heath and maybe the older argonaut.
REAL AMATEUR radio. Although some of them appliances sure are neat too.

Diplexer vs Amplifier after mixers

I looked this up in THE book written by the staff at Collins and they only mention the impedance match as a reason for doing so. I wonder, though, about things like images or out of band products overloading the IF amp. Your dynamic range may be high in many cases BUT the potential for intermod type problems could be present and just not exposed in the test???

I assume that any IF stage must somewhere contain a bandpass to get rid of the undesired image. Given this, the other "stuff" must go somewhere else. Therefore, it is by definition a diplexer because there are two paths????

>This is supported by my excellent results.
>Does anybody KNOW why the professionals do so?
>Please no assumptions!

The diplexer filter after the mixer serves as a low-pass filter. It typically has a high (>= 20dB) return loss at the IF frequency and terminates higher frequencies. The mixer ports like to see nice resistive 50 ohm terminations for optimal IMD performance. It doesn't sound like you measured IMD. Feeding the mixer output into an amplifier such as you have degrades the mixer's third order intercept point compared to a resistive termination.

I suggest trying the diplexer filter and compare the results with what you obtained using the amplifier. And make some IMD measurements....you'll find the results interesting.

The HW-7 and HW-8 are *direct conversion* receivers, not single conversion;
RF from the antenna is fed directly into a mixer (no front-end), and the LO
beats it down directly to audio -- there is no IF at all. The HW-9 is a
superhet (i.e, it has an IF), although I don't know whether it's single
or double conversion. I think it also has no front end, but I'm not sure.
The HW-7s I've used had truly *awful* microphonics (mechanical vibrations
picked up by the set and sent to the audio output; a common problem for
direct conversion receivers). The HW-8 was much better in that department, and
the HW-9, being a superhet, did not suffer at all.

>This is supported by my excellent results.

The diplexer is a passive 50 ohm load which acts like a broadband Constant Z BPF (Mini-Circuits advertises these as constant Z BPF's). These offer some selectivity. Usually a 1dB I.L. slowly rolling off. XL and XC of components are usually 50ohm for best performance.

Whereas the FET Post Mixer-IF Amp offers a fairly constant load over a broad range plus Gain. I`ve used all three combinations in building my SSB/CW Xcvr's with excellent results...especially in this high HAM population area around Chicago, IL. Don't have my RF Analysis printout here, but the Dynamic Range was in the 110-120dB Range.

I've used the U-310 for the Amp, and have found excellent results using the Double Balanced FET Mixer described by Ed Oxner of Siliconix.

1257. Charging batteries with solar cell

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-24 19:11:32 UTC
From: buckij@thor.acc.stolaf.edu
Message-ID: <1991Jul24.191132.4424@news.stolaf.edu>
Source record: 295088

Hello,

I've recently purchased an IC-02AT, I haven't got it yet so I don't have the manual. I was wondering about a couple of things that maybe you could answer.

1) What is the maximum current I can put into a BP-8 or BP-3 battery pack? Wattage?

2) Can I be charging the attached battery and using the HT at the same time? (Using the charging battery as the power source.)

I'm working on connecting a solar pannel to the battery pack to charge it. Many of you have come up with different responses to my question of how to do this. They range from "just hook it up with a diode to prevent backwards flow problems" to "you need a regulator!". Ideally I would like to just charge the battery while using it. (I also don't want to fry the battery.)

The solar cell I'm looking at puts out 12 (max 16.8) volts at .27 amps. Could I regulate the voltage and the current and successfully charge the battery while using it? Is there something hopelessly wrong with this picture?

Thanks much!

Jonathan Bucki

From: reichert@motcid.UUCP
Message-ID: <4951@cocoa46.UUCP>
Source record: 295085

Some additional thoughts...

The Diplexer would more likely be used after an active (Gain) Mixer and the Amplifier after a lossy Mixer.

Also depends on where your Noise Figure determining point in your receiver is! A 1.8Mhz Receiver would probably have some RF filtering prior to an activer Mixer, whereas a Mixer downstream after some Gain stages should be passive. Most of the receiver gain should come after any Xtal Filters (Properly terminated) and after the Mixer stage to improve IMD.

I worked up an RF IMD/NF/Gain etc Analysis on a 123 Spreadsheet which agrees fairly close to measured (used at prior job also) values.

Was your 110dB Dynamic Range the Spurious Free, AGC Range, or Desense Range?

Chuck Reichert KD9JQ

1259. Re: post-mixer amplifier

Almost forgot...to answer your question as to why there would be a diplexer following the mixer then an amplifier...simply to provide a constant load to the mixer while providing an equally important constant source to the amplifier..such not to degrade it's performance. Every little bit helps!

The Mixer by itself is a poor constant source over frequency.

Jim,

You would do well to check the Feb. 1991 issue of 73 Magazine, p.52, which
gives a good listing of microwave mail-order joints.

Alpha makes a number of Gunn-source motion-detector "heads" which are
perfect for your task, and can be obtained from SHF Microwave Parts
at 7102 W. 500 St., La Porte, IN 46350 for $50 new.

MA/COM's original Gunnplexer is an expensive alternative, but with the
nice feature of a built-in ferrite circulator. Expect to pay >$125 for
a new one. Retailers in low quantity include Advanced Receiver Research
(i.e., W1VD), Mountaintop (i.e., NS6X), and Satellite City.

Somewhere, somebody is selling, surplusing, or marketing the Japanese
versions of these motion detectors, and I would love to know who.
Perhaps you will find out.

Hope this helps,

Marshall Jose WA3VPZ

>bet they'd start asking to see licenses before selling the gear.

You are right in the sense that the answer to the problem is personal
accountability but wrong in its application. The solution is to catch
those who violate the law and prosecute them (yes, I know, not an easy
task). Radio Shack is a far easier target but the wrong one. It isn't
their fault that their equipment is being misused. It would be like suing
EVERY ham manufacturer because there is someone out there misusing their
equipment. If sued, their solution will not be to check for licenses.
Instead, they will get out of the business entirely. Competition in
the field of ham radio gear will go down. Cost of equipment will go up
(in part due to increased liability insurance). Is this what people want?
To paraphrase a similar situation, "ham radio gear doesn't violate fcc
regulations, people do".

Well, my first attempt was mangled by somebody's mailer or the digestifier.
Let's try this again.

From time to time, this list has discussed reception of cordless phones,
baby monitors, and more.

But, has anybody tried to capture those new wireless TV units that let you
send a signal from one part of a house to another? I believe these are
around 900 mHz or so; are there several channels, like on cordless phones?
What are the actual frequencies these are supposed to operate on?
With a good antenna, such as a 5- to 10-element Yagi, what might be the
effective range in a suburban area (probably best rated in "houses")?

(Looking for new frontiers in scanning)

With projects, it's always a "build" vs "buy" decision. So what if the author uses an obscure chip available only through dealers in Outer Mongolia ? If the reader has the brainpower to fully understand the design and substitute their own suite of parts, fine.

Which brings us to the motivations for building projects. If you're building to save money, you're wasting your time - buy it instead. If you're building to understand how something works, then obscure chips and nonexistent firmware can be worked around. It just takes longer. Ever build a Curtis 8044 equivalent from discrete TTL ?

Yes, a common trick is to include a "ringer" in the design to recoup development costs. It costs authors time and money to produce a design that works for bogey parts and under varying shack conditions. I have no problem with that.

What I have a problem with is the attitude that wetware results are free. Most engineers are paid around $100K/yr (including overhead), so giving away a working product for the price of publishing is generally insane. I look at buying "ringers" as providing an incentive to the author to come up with more ideas to publish. Do you suppose the current dearth of technical articles and construction projects has anything to do with their low Return-on-Investment for the author ?

I suspect Ed Humphries at Texas Instruments is also an engineer. I agree with his attitude.

The great thing about QRP rigs is that you can use it to drive a grid-driven tetrode final (e.g.4CX250B) and have a REAL radio capable of 500 watts PEP. Going the other way with a QRO rig is not so easy.

A local QRP enthusiast (who shall probably read this) used an older Argonaut with an amp I sold him. The arrangement works quite well. Beware of crummy receivers - QRP means "low power transmitter", not "cheap". Make sure the manufacturer didn't chintz there.

>However, I have been very curious about so many Soviet hams now wanting to
>QSL direct rather than through the bureau. I have only QSLed to one
>direct with a green stamp as he was in one of the republics I don't have
>confirmed. I have not received a card and doubt if I will. I still QSL
>almost all of my Soviet contacts via the bureau.

The implication here, although you may not have intended it, is that the Soviets seeking to QSL direct are doing so because they want green stamps. I don't think that's fair.

It may be true in some cases, but consider their point of view: Their rubles are worthless if THEY need to send return postage for a DX card THEY want, and they cannot buy IRCs in the Soviet Union even though the Soviet post office will honor them. Likewise, if they wish to apply for an award that needs return postage or IRCs, how are they supposed to get them?

There are a lot of other reasons that a Soviet ham would wish to QSL direct. One is the novelty of it -- as you probably know but others may not, until recently Soviet hams were not supposed to QSL direct, but only through Box 88 in Moscow (the central radio club). The ability to QSL direct is something new and interesting for Soviet hams. Another reason: the Soviet bureau is incredibly slow.

I am lucky to have a ham friend in the Soviet Union who is my "QSL manager" in the Soviet Union -- he sends out most of my cards for me, and accepts cards for me at his post office box. So, I don't have to rely on the bureau. But when Soviet hams specifically ask me to QSL directly, I usually do. However, unless it's a card I'm really, really after, I almost never send either green stamps or IRCs -- I'm spending enough on postage. I explain this in a note (in rather poor Russian) with the card, and tell them they can QSL via the bureau or through my friend's post office box in the USSR as well as direct. Often, I send a short letter as well. In just about ALL these cases, the Soviet ham has responded by returning his card to me direct. So, based on this experience, I would conclude that they are not asking me to send my QSL card direct just so they can get a green stamp.

If you don't get a return card from the republic you want, I would suggest sending another card to your Soviet ham penpal and ask him if he would mind mailing the card to the ham for you, WITH return postage so the card you want can be sent back to your FRIEND, who can then mail it to you in his next letter. I bet your friend would be happy to do this for you, and it would increase the chances of the mail getting through. I have had mixed luck sending green stamps in the mail.

I was led to believe that Ham's are a self policing bunch. We have part of the responsibility for making sure that the amateur bands are not abused. I think, in the event of some local intrusion into the 2 meter bands, we are well equipped to locate the abuser, in conjunction with the local authorities and the FCC EIC. This sort of possible (probable????) abuse of 2 meters is a direct way in which we could prove that we have earned the right to use portions of the radio spectrum. If hams could help prevent this problem, legistlators might not think of amateur radio as a leech, and think twice before cutting allocations.

Or maybe not.....

Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

I have a Kenwood TS-430-S and mods that I have show to remove R7 and R8, and short out R7 on the RF Unit. The 3 resistors comprise a 20 db attenuator that are in the RF unit for the broadcast band.

Your TS-440 should be close. On the RF unit there is a series of diode switched filters. The attenuator is situated between two .015 caps.

Good luck.

1280. How do aircraft RDF antennas work?

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-25 04:05:17 UTC
From: thompson@cactus.org
Message-ID: <8329@cactus.org>
Source record: 295091
Cross-posted to: rec.radio.amateur.misc,rec.aviation

I am curious about the RDF antenna systems used on
aircraft to track non-directional beacons (200-500KHz).

I know that there are two antennas: 1) omnidirectional phase
reference 2) some type of loop/crossed loops. The readout
in the cockpit points in the direction of the station. Do
these things look at phase? or amplitude (via nulling) or
what? Anybody out there familiar with the theory of operation
of these beasties?

Message-ID: <349.9107250929@turing.sa.co.umist.ac.uk>
Source record: 295102

Hi,

Having seen all these mods flying around about modifying the rx sensitivity of Kenwood gear for m.f. I wonder if anyone has similar information for Yaesu rigs.

I have a FRG8800 comms rx (from before I was licenced) and it automatically puts a 20dB attenuator in below 1.6MHz. I really would like to get rid of it. The rig is well out of warranty so I don't mind poking around if someone has the details.

Thanks,

Nigel G0NGL,

You are write, but I use a rather good preselecting filter for every amateur
band, so ....
The only unwanted signal that enters the post-mixer IF-stage is the residue of
the oscillator signal, which is still -10 dBm (worst case). Of course this
signal was present during my measurements. So ....

Herbert.

> Chuck Reichert KD9JQ

Still no answer to the question.... If I use a good preselector there is no
need for selectivity there. The only unwanted signal is the oscillator residue
which does not boarder seeing the results (third order IP > 30 dBm).

By the way, the U310 offers a slightly worse match to the mixer than a P8002
because of less isolation of the fanciful impedance of the Xtal-filter (XF9B)
from the source input impedance.

Herbert.

>Was your 110dB Dynamic Range the Spurious Free, AGC Range, or Desense Range?

> Chuck Reichert KD9JQ

I agree,
the post-mixer amp with the P8002 has a noise figure of 3 dB.
The conversion loss of the DBM is 6 dB so I have a nett noise figure (mind the mirror!) at the entrance of the DBM of 9 dB.
For 10 meter I need a noise figure of 12 - 14 dB so the preselector still may have some insertion loss (at 1.8 MHz the noise figure can be more than 35 dB so you need an extra atanuator to ensure the dynamic range!!).
The IP3 of the SRA1H on input is +30dBm. The IP3 of the P8002 is > 30 dBm (at about 30 mA) so there is no contribution of the post-mixer amp on this point because of the 6 dB convertion loss of the DBM.

But, the question is still not answered ....

Herbert.

Sorry,

I made the mistake of assuming, and you know what they say about assume,
that everyone would know the meaning of green stamp as everyone chases
DX, don't they? :-) :-)

A green stamp is a U.S. dollar bill. An IRC is an International Reply
Coupon. IRCs cost, I believe, around $1.00 now and can be purchased
at your U.S. Post Office. However, don't be suprised if the postal
clerk doesn't understand what they are. They are coupons that can be
exchanged for postage. A single IRC can be exchanged for ONE UNITE OF
SURFACE MAIL, in the case of the U.S., this would be a 29-cent stamp.
They are used to send with a QSL card for the other station or QSL
manager to be able to exchange for postage for mailing a QSL card back.
The problem is that it often takes several IRCs to purchases proper postage;

hence the habit of sending a green stamp so the other ham can buy stamps. The problem here is that in some countries it is not legal to possess U.S. currency and in many countries, such as Germany, an air mail stamp costs more than $1.00 U.S. (our rates are actually pretty reasonable).

As many hams get IRCs that are not redeemed, it is possible to buy them for less than their market value. Check around for DX clubs or addicts and inquire if anyone has IRCs for sale. The rules of DX QSLing are:

1. Always ask the station how to QSL:

- If "via the callbook" is the answer, ask if need GS or IRCs. (The callbook refers to two books published which list amateur radio operators names and addresses. There is one for North Amercican hams and another for all other countries.)

- If he/she gives out the address on the air, try to get last name -- you want to avoid using callsign in the address. (It is surprising the number of hams on the air who are not in the most current callbook).

- If "via the bureau" is the answer, but you want a fast QSL to confirm a new country, ask how to QSL direct.

2. Hope the station has a QSL manager in your country; then all you need is an s.a.s.e. (self-addressed, stamped envelope), as opposed to an s.a.e. (self-addressed envelope).

3. If station requests a green stamp, and it might be two nowadays, send the GS along with QSL card and s.a.e (fold the GS inside the s.a.e. so it is not obvious).

4. If the station requests IRCs, send them with the s.a.e.

5. If you really don't need the country for DXCC (DX Century Club), send the QSL via the bureau and hope you get a return. However, be aware that not every country on the DXCC list is serviced by the ARRL outgoing bureau and that the ham you QSO'd with may not belong to his/her country's ARRL compliment, so that person may not get QSLs through their incoming bureau.

Be prepared to get taken a few times. There is one very well known foreign ham, I will not mention his call, who seems to be the QSL manager for lots of DXpeditions (special DX operations, usually to a rare country). So, when I need a QSL, I send a GS. It never fails; when I get the QSL card the envelope always has a California post mark. Not a bad profit; get $1.00, buy a 50-cent stamp. This is, in my opinion, a forced contribution for equipment or DXpeditions. 50-cents won't break me, but multiply that by several thousand, just for U.S. QSLs, and it amounts to a fair amount of change.

Anyway, I hope I have answered your questions. Ham radio is great, especially DXing -- enjoy!

>be used? Where can you get them? How do you redeem them?
>
"Green stamp" is indeed slang for an American dollar-bill. An "IRC" is an
International Reply Coupon (which, just to confuse things, is in fact
also green :-)). An IRC can be purchased at many post offices in the
United States and, most other countries of the world. Even countries such as
the USSR which do not SELL them will honor them. (I do know that they werenot
good in South Africa, presumably because S. Africa was barred from the
international postal union. Perhaps that will change). Here, they cost
95 cents each.

The International Reply Coupon that you send to a ham overseas can be exchanged
for postage stamps in his or her country. As I understand it, in the USSR
one IRC can be exchanged for the equivalent surface-mail postage rate
to America, while 2 IRCs can be exchanged for air-mail postage to America.

>
>The implication here, although you may not have intended it, is that the
>Soviets seeking to QSL direct are doing so because they want green stamps.
>I don't think that's fair.

You are right, I did not intend it. I understand the problem of getting
QSLs through Box 88 and why Soviet hams would like to QSL direct to
get QSLs in a timely manner. However, I doubt if they realize the cost
of doing so for other hams and wonder how they can afford it. I QSL
all my Soviet QSOs, and go through the bureau except for the two republics
I still need.

There was no malice intended in my statements. Compared to hams in all
other countries, the Soviets have to rank highest on courtesy, operating
procedure and playing by the rules. I have never heard a Soviet "policeman"
on a DX stations transmit frequency during a split operation. I cannot
say that about any other country.

Also concerning this, anyone any idea about a phenomenon that I encountered flying in Finland last summer (I don' assume it's anything that particularly happens in Finland only ?-)):

For at least two or three different ADF's we had a good indication with only one thing: the needle pointed directly in the *opposite* direction. (and please don't blame me for bad navigation; we were flying along the southern cost and had Helsinki as reference).

Any ideas ?

Amateur Radio is Not a Crime. There's nothing wrong with Radio Shack getting into the ham game - if we as a group play our cards right it should improve the visibility of amateur radio to the general public and could be a tool in getting amateur radio viewed in a positive light by the general public as a whole (compared with being blamed for everyone's electronic equipment problems just because we have an interest in things electronic).

it's going to make things easier for me when the RS stores start stocking "Now You're Talking" since the 1 outlet we have in town is a bit out of the way for some folks. (stores here haven't received any copies of NYT yet... supposed to soon.)

And of course, holding a license is not a check on behaviour either. There is the extra class ham, a school teacher to boot, who pleaded guilty to charges that in April he broadcast false distress signals over a Prince William County, Virginia, police radio frequency and used an unauthorized credit card to buy equipment from the store.

My neighbor, a newly licensed ham, wants my advice on which dual-band 144/440 mobile rig is "best." I have not purchased a new mobile rig in several years, let alone a dual band. Comments/recommendations are solicited!

1293. Radio Shack HT

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-25 15:15:28 UTC
From: hwd@pyuxa.UUCP
Message-ID: <11@pyuxa.UUCP>
Source record: 295120

Thanks to the poster who confirmed my original
question regarding the imminent availability of
2-meter handie-talkies at Radio Shack.

I am glad that ham radio will get additional
publicity by virtue of Radio Shack's action,
but I am concerned that 2-meter HTs will be
yet another option for people who want inexpensive,
effective, and unlicensed two-way radios. Already,
the so-called itinerant business-band frequencies
are being used for unlicensed operation. I've seen
vendors at flea markets using marine-band radios to
communicate. The 2-meter band could become another
fertile area for exploitation by unlicensed operators.
We have to keep our guard up.

By the way, the Radio Shack 10-meter radio, the HTX-100,
doesn't appear to be the choice for CB pirate types. According
to the Radio Shack catalog, it is capable of USB and CW
operation only. I would imagine the pirates would prefer
the Uniden 10-meter radios instead.

> I measured the sensitivity of my Yaesu FT-470...

Your measurements seem comparable to those done on my FT411. (But not directly comparable, as we measured sensitivity in uV based on a minimally audible signal.) In both cases it appears the designers used a wide front end coupled with a high IF (17.3MHz) for image rejection, rather than varactor tuning. The IF wasn't really high enough to do the job, so the FT411E now has a 21MHz IF (I think).

Here are the numbers we got. It makes a decent plot.

```
MHz uV err

To paraphrase, if you're planning on getting rich by publishing articles and
getting paid for them, you're wasting your time. No one is suggesting that
Curtis has to give away code *unless* they want to get paid for the article.
They can buy ads, or do construction articles where the proprietary item is
a minor part (cf August QST).

|>
|> Perry Scott / AA0ET
|> "just another engineer at HP"

I design/construct circuits. I write/compile software. What's the difference?
Why is a program "wetware results" yet a circuit diagram is not?

The issue is that there is essentially no difference between circuit diagrams
and programs. The issue is that *construction* articles should be complete or
they should be called something else.

1297. NiCad rejuvenated

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-25 15:38:17 UTC
From: ajs@hpfcdc.HP.COM
Message-ID: <39910096@hpfcdc.HP.COM>
Source record: 295048

We successfully rejuvenated a NiCad cell as an experiment. (Me, N0MFW, and Perry, AA0ET.) I thought some of you might like to hear about it.

I have a Black and Decker rechargeable flashlight (Spotlighter) at home. Before I learned that constant trickle charging is generally a Bad Thing for NiCads, I used to leave the flashlight on the charger. Sure enough it lost capacity after about five years (not sure exactly how many), of only occasional use (few duty cycles), to the point of being unusable.

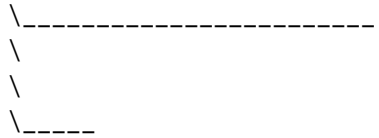
I opened it up and found three NiCad cells. Perry has a nice setup for fast charging NiCads, and for doing a constant current discharge of them while capturing voltage measurements into an engineering workstation. We decided to play with this battery. His setup made it relatively easy to plot the performance of the cells. It was quickly clear that one of the three had almost no capacity. The plot was a step function sort of like this:

That's the sign of one cell going out well before the others. Since three cells only yields about 3.8V, apparently two were not enough to even make the bulb glow.

Perry identified the bad cell by measuring individual cells with a meter. He bought a syringe ($0.10) and I brought in some distilled water. We tried injecting it through the apparent rubber gasket hole in the end of the cell, but it squirted back out. Apparently the geometry of the metal casing didn't permit a direct shot into the cell.

So I drilled a hole in the side of the cylinder, being careful not to go further than the case metal. With this we were able to inject a lot of cc's of water into the cell. As it filled I had to inject more slowly, apparently as it seeped in. Eventually it foamed back out and I stopped.

We ran the battery through two more cycles. In both cases the plot was more like this:



That indicates rejuvenation. The area under the curve was about 2500 seconds at 3.5V with a draw of roughly 1A, or about 0.7AH, which is about right.

I put the battery back in the flashlight, charged it on the charger, and ran it on the "low" setting. It ran for over 1.5 hours, the documented discharge time, before becoming unusably dim. "Good as new?"

Now, the hole I drilled is only covered with duct tape. It did leak some crud under a high rate charge. I'm going to continue using the light with only as-needed (not constant) trickle charging, and the hole only sealed with duct tape, and see how it lasts.

This business was made much easier by having a constant current load and a data capture capability that allowed plotting. You can probably accomplish the same thing by taking periodic measurements of all cells with a meter, and then individual cells after the first voltage drop, while draining through a resistor.

I am not an expert on testing techniques but the intermod products of concern result from two IN band signals so a preselector will not help. A two tone test would be needed to find out. One thing for sure is that every receiver design is unique and depends exactly on what potential products can be troublesome. As I recall in many of our designs (not at Tek but Lockheed) we used to pad the LO port for better isolation and only used special terminations on the IF when cross products were a potential problem. It all depends on the whole picture. Anyhow, I beleive the two tone test would put it all to rest.

1299. Potential Geomagnetic Storm Warning Cancellation - 25 July

Message-ID: <910725103355.20201141@HG.ULeth.CA>
Source record: 295123

/\

POTENTIAL GEOMAGNETIC STORM WARNING

CANCELLED: 12:00 UT, 25 JULY

/\

ATTENTION:

An interplanetary shock from the last major X-class flare has failed to arrive. Geomagnetic activity is no longer expected to pass storm level event thresholds. Conditions could still become unsettled to active over the next 24 hours, although nothing particularly energetic is forecasted.

Solar activity has remained relatively low over the past 24 hours. Only C-class flaring has been observed. Region 6734 (the dominant region presently visible) is maintaining its delta configuration. It is now classed as a beta-delta region and continues to exhibit strong magnetic fields and gradients. A major flare could erupt from this region anytime now. Region 6734 will cross the central solar meridian today and into the western hemisphere. It is now well placed for producing terrestrial impacts should another major flare erupt. There is also a moderate possibility for proton arrival should a major event occur. Associated PCA is not out of the question.

This Potential Geomagnetic Storm Warning has been cancelled.

Source record: 295125

In article <9107251439.AA27967@ucsd.edu> wright%morekypr.BITNET@cunyvm.cuny.edu writes:

Correct me if I am wrong about this but 800 mhz is for Celular Telephone,
CORRECT?

yes, among other services.

I just saw an add for Radio Shack in a local paper advertising a 200 channel
handheld scanner for sale for $229.95. The add shows the scanner covers
Fire/Police/Ham/Air/and 800 mhz.

I thought that scanners that cover the 800 mhz spectrum were now illegal to
be sold. I may be wrong so if I am Please correct me on this.

you are wrong. the ECPA of 1986 only prohibits the sale of equipment
whose sole purpose is to listen to "protected" frequencies. general
purpose scanners are legal. some companies, like rad shak that also
manufacture cell phones disable the 800 mhz reception on their
scanners. this is usually very easy to restore (add or remove a
diode) so everyone is happy. the salesman can claim that listening to
cell phones is illegal and they don't sell scanners for it and the
scanner listener can still buy scanners that can recieve 800 mhz.

What is the regulations on this. I want to purchase a new handheld
scanner but not if there is a chance of me getting into trouble with this
radio. I know there are other handheld scanners out there but I don't
want the hassell of mail order or having to travel for an hour to purchase one.

The ECPA still prohibits listening to cell phones. Mere posession of
your scanner is legal, except in cars in some states.

It's more profit than that - it's $1 in exchange for a 29c stamp, surely?
When you consider how much it costs to mount an expedition, 71c isn't such
a lot for you to contribute (this includes the cost of a card too, remember).
When you think of how much you spent on your station, 71c isn't so bad if
you really want that country confirmed. I'm assuming here that the 'profit'
goes to the Dxpeditioners, not to the manager - depends who you are talking
about.

>from the source input impedance.

I work up at 6 and 2 Meter Bands and use Broadband front ends...hence tighter requirements on everything downchain.

As far as the U-310...I'm sure there's many devices out there now that are better or have different characteristics to suit each need. I built my own 13.1Mhz 8 Xtal Ladder filters with surprisingly symmetric side lobes. Got the 6dB points at 2.7Khz, shape factor around 2.5, and Ultimate Rejection greater than 90dB. Rs,RL around 150-200 ohms. I.L. around 6dB if I remember right. Anyways, I used Broadband Loading/Z Xfrm from the U-310 to the Filter with a trimmer cap to set the required Xc at the ports. Of course I had an Analyzer I could borrow which helped immensely.

Oh...why 13.1Mhz?...cheap 25 cent small metal case xtals!

Also downconverted to a 455khz $2 surplus Mechanical filter I found with 14dB I.L. 2.4khz BW requiring 300 ohm source/ load with 1200pf caps at the input/output. Only .3dB ripple...works great. Also use the L.O. shift to overlap the I.F.'s producing a 400Hz Bw without the ringing!

Well, getting past the point here, just like talking shop...HI!

1303. Re: How do aircraft RDF antennas work?

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-25 17:57:00 UTC
From: CSMSCST@MVS.OAC.UCLA.EDU
Message-ID: <9107251758.AA14654@ucsd.edu>
Source record: 295124

The typical aircraft ADF (automatic (radio) direction finder) consists of a small (4"x6"x1") antenna mounted on the bottom of the aircraft. This antenna consists of two loopsticks (coils wound on ferite rods) mounted at right angles. The output of the two loopsticks is fed through matched coax cables to the instrument panel, into a receiver and then into a display called a goniometer. The goniometer basically replicates the field sensed by the crossed loopsticks, and its pointer just responds to the vector sum of the field. By itself, this method has a 180 degree ambiguity, so an additional omnidirectional antenna is used (usually a short wire). This is called the sense antenna. Combining the output from the loopsticks and the sense antenna gives a cartiod pattern, which resolves the ambiguity.

> For at least two or three different ADF's we had a good indication with
> only one thing: the needle pointed directly in the *opposite* direction.
> (and please don't blame me for bad navigation; we were flying along the
> southern cost and had Helsinki as reference).

Wolfgang, perhaps you were flying upside down. That would invert the directional reading. No..., I suppose you would have noticed. Actaully, there are two sources of error. The relative phase between the sense antenna and the loops is critical to resolving the 180 question. Various resonences (eg, the wings in large aircraft), other antennas, cable lengths, can alter the phase relationship enough to make the sense reverse. Generally the ADF installer has to play with the location of the sense anetenna until a place is found which gives correct readings over the frequencies of interest. Usually ADFs are certified over 200-500 Khz. If you use AM BC stations in the 530-1600 Khz range, you may find a a frequency above which readings are reversed.

The other source of error (though not a 180-degree reversal) is that you quickly learn that radio waves, despite the physics books, do *not* always travel in straight lines. If you have access to an ADF, try listening to AM stations about sunrise or sunset. I've seen the pointer swing 30-40 degrees off the direct bearing, hold for several seconds, then point back, cycling over and over. Presumably this is ground wave/sky wave interference, with the sky wave reflecting off a patch of ionization not in a direct line

with the station. Also, ground waves themselves will bend
when passing over a land/sea interface where the coastline
is not perpendicular to the line of propagration (similar to
refraction).

Now you know why it's not a cool idea to use an ADF as your only
navagation instrument!

>N0MTA

A couple years ago I homebrewed an interface and software to
send and receive color SSTV with an Atari ST. The hardest part was
finding specifications for the transmission formats.

Robot: Described in an appendix of the 1200C manual. I purchased a
manual directly from Robot for $25. There is not a single mention
of copyright, confidential, etc. so I guess it is ok to make
copies and pass them around.

Volker Wraase: Found a second hand description in a reprint booklet of
old A5 articles from ESF copy services.

Martins: Martin Emmerson was kind enough to send me a description of his
mode. He asked that I not give copies to anyone. He wants to be
in direct contact with all homebrewers implementing it so they all
have the most recent and accurate information.

Scottie: My third or fourth hand information on this is so goofy I can't
believe it is correct. Eddie Murphy (the inventor) didn't answer
my letters. Can anyone help me with this?

AVT: Black belt systems was not allowed to give me this information due
to the contract with AEA. AEA would not give me the information.
I figured it out by writing a "software oscilloscope" and
studying the output of my SSTV demodulator. I described the
format in an article published in a couple of the ham TV magazines.

Sorry, I don't have more specifics with me right now.

For an overview of color SSTV transmission formats, see my article
"SSTV for the Atari ST" in 73 magazine. Dec 89 & Jan 90 if I recall
correctly.

e-mail me directly if you'd like more specifics to homebrew your own system.
If there is sufficient interest, I'll post a bibliography of information
sources.

73, John WB2OSZ

p.s. Does anyone know if there is a color SSTV system available for
the IBM PC? There is a product from a company named something like
Software System Consulting but it is only black & white.

Me too!
I have built my own WEFAX demodulator, mostly out of software on a PC clone, and would like to see some Ham SSTV. If I just knew the scan format (lines/sec, lines/frame, conversion between AF tone & brightness, etc) it would be a breeze. The Handbook is very vague on this point, and the new formats are not in there.

If you have info, pse post to the net

I also vaguely remember that I heard the same words as you wrote.
However, the postal bulletine (jan 24, 1991) says:

IRC: a) selling price for U.S. issued coupons: 95 cents.
b) redemption price for foreign issued coupons: exchangeable for postage
stamps at the rate of 50 cents.

By the way, the current overseas surface rate is 70 cents (except canada:
40c, and mexico: 35 c). Did they take an average of (70+40+35)/3=48c :-)
I don't know what happended.

Three comments.

Alan's case is classic electrolyte loss. There may be other failure modes, but I haven't seen them.

Drilling a hole in a battery can be quite exciting. Make sure the cell is dead, i.e. has been shorted for several hours. They can come back to life and still cause quite a bit of heat.

How do you plug the hole after you've drilled it ? I dunno. Maybe epoxy would be airtight. The drilled cell sizzled out the hole a little when charged over 300 ma. Normally, the gas just recombines but in this case some electrolyte salt was lost so the capacity probably went down. It probably makes sense to charge drilled cells at .25C max on a peak charger.

Do an anonymous ftp to apple.apple.com and cd to the /pub/ham-radio
folder. There are 2 good Mac based code practice programs there.

You can also get all of the Ham Exam questions in a Hypercard stack on
uxc.cso.uiuc.edu in /pub/ham-radio.

1315. Diplexer (was Post-Mixer Amplifier)

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-25 22:53:50 UTC
From: dana@locus.com
Message-ID: <1991Jul25.225350.2485914@locus.com>
Source record: 295059

My understanding is that the diplexer is present to make certain the mixer is is properly terminated for all output products. Suppose you have a front end with 14 Mhz input and a 9Mhz IF; the local oscillator is 23 Mhz. The output of the balanced mixer contains the sum and the difference of the inputs. i.e. both 9Mhz and 37Mhz. Since the performance of diode balanced mixers is fairly dependent on the port terminations, one needs to make certain that the 37Mhz output is terminated into the correct impedance also. Diplexers are generally a series resonant circuit connected to a terminating resistor to ground.

If the post-mixer amplifier indeed presents correct termination to the mixer for both the sum and difference outputs, I'd guess a diplexer is not necessary.

Source record: 295055

/ wright%morekypr.BITNET@cunyvm.cuny.edu / 8:25 am Jul 25, 1991 /
*Correct me if I am wrong about this but 800 mhz is for Celular Telephone,
*CORRECT?

Partly correct. Part of the 800 MHz band is for cellular, specifically
823.9875 to 849.0125 and 868.9875 to 894.0125 MHz.

*I just saw an add for Radio Shack in a local paper advertising a 200 channel
*handheld scanner for sale for $229.95. The add shows the scanner covers
*Fire/Police/Ham/Air/and 800 mhz.

The other parts of the 800 MHz spectrum are used for various things, TV links,
State Park rangers, etc, etc. Where I live the lower cellular band 824-849
seems to be used these things also, only the upper band seems to have
phone calls around here.

*I thought that scanners that cover the 800 mhz spectrum were now illegal to
*be sold. I may be wrong so if I am Please correct me on this.

The scanner will have the two sections of the band for cellular phone
locked out, but recieve the rest of the 800 MHz band. Most scanners
can have the cellular phone bands unlocked by removing a single resistor
or diode from the microprocessor PC board.

*What is the regulations on this. I want to purchase a new handheld
*scanner but not if there is a chance of me getting into trouble with this
*radio. I know there are other handheld scanners out there but I don't
*want the hassell of mail order or having to travel for an hour to purchase one.

The Federal Communication Act of 1986 makes it illegal to LISTEN to
cellular phone calls, but did not make possesion of equipment capable
of listening illegal. There are differing state laws, and may be some
newer federal laws. You can still get in trouble with a legal scanner,
some states have laws against listening to cordless phones, and all
scanners can get those. Also many states have laws prohibiting scanners
in cars.

> IRC: a) selling price for U.S. issued coupons: 95 cents.
> b) redemption price for foreign issued coupons: exchangeable for postage
> stamps at the rate of 50 cents.
>
> By the way, the current overseas surface rate is 70 cents (except canada:
> 40c, and mexico: 35 c). Did they take an average of (70+40+35)/3=48c :-)

Overseas surface is 70 cents per ounce, but overseas airmail is 50
cents per half ounce. Therefore, it would seem reasonable for the
USPO to claim that giving you 50 cents for an IRC is a reasonable
exchange.

1318. Radio Shack 2 Meter

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-26 03:51:32 UTC
From: ds1437%BROCK1P.BITNET@cornellc.cit.cornell.edu
Message-ID: <9107260051.AA17860@ucsd.edu>
Source record: 295034

As a college Student, I am forced to have a full time job during
the Summer, Well I am currently working at Radio Shack this summer.
The rumor is true, RS is comming out with a 2 Meter Handheld, I
was putting the NEW price tags up today when I ran across it:

Handheld 2 meter FM Transceiver
12 Memory, 3 Priority, 1 Calling Channel
MultiFunction Scanning
Tone DTMF squelch Built in

Only For $259.95

no more info was available, due to it not being in our POS System
yet. However It does seem like an OK deal for a person starting out.
I have had a few people in the past look at the 10 Meter Rig
that RS sells, although I have never sold one yet, I usually try to
get to know the customer to see if he is responsible enough to use
the equipment. I don't think I would sell a 2 meter radio to some
Yahoo who would probably use it for drugs or something. However I
guess I am one of the minority of salesman who would not sell it to
him because I would rather have the bands clean instead of
converting 2 Meter to another Cowboy band :-) A really good example
of this is when I had some Hick farmer (Not to insult those Real
Farmers) was looking for a CB when he stumbled on the 10 Meter RIG.
He asked me about it and I said that it was for amateur radio, of
which you must have a license for to use. The customer started
getting Irate! He started swearing and saying things like "It's my
F**k**G air I can do anything I want, the government can't F**k**g
stop me!" Well, I told him that we must first see a license, before
you can buy it (Which IS NOT TRUE) I still sold him a CB and made
some money.
I am worried that most salesman will not care to who they sell
it to. I think I will write a letter to Tandy Headquarters (I can do
that through the POS system) and see If I get a response from Tandy.

Source record: 295042

Jonathan ,
What type of solar cells will you be using on this project???

Here at Iowa State University - we designed and built and raced a solar powered race car (GM Sunrayce) and I had to become an instant expert on the subject... (senior in electrical engineering).

We used standard silicon cells (about 1 Watt ~ .2 amps -- you can solder them together to get any voltage you want)...
Gallium Arsenide cells are much more expensive (up to $50 per cell) but more efficient. However they are very hard to work with (about the only people who use them put 'em on satelites). Ours were about $5 per cell (4 in X 4 in). and were manufactured by Siemans Solar Division.

Hope you have fun with the project and e-mail me for any circuit advice you may need (battery charging can be tricky). Good luck with your license.

The use of am stations for practice approaches is common here at UND.
I once had instructor chew me out for not being able to do well under
these conditons. Until I learned that the am station had a phased array
of three antennas on the ground and the ADF receiver in the plane was
picking up the strongest one. At the point of station passage on one of
these towers, the ADF needle suddenly shifted to show the next strongest
tower to my left. Because I was exactly over the first tower, I had the
greatest null off of the top of that tower and that is what caused the
apparent problem. Had no more problems with that instructor after I
explained this to him. We never practiced over that am radio station
again.

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
July 26 to August 04, 1991

Report Released by Solar Terrestrial Dispatch
P.O. Box 357, Stirling, Alberta, Canada
T0K 2E0
Accessible BBS System: (403) 756-3008

Based In-Part from Data Supplied By
The Space Environment Services Center

SOLAR TERRESTRIAL REVIEW FOR 19 JULY TO 25 JULY

Solar activity this week ranged from low to high. Region 6734 proved to be the most active region, as far as flare output goes. This region spawned two X-class flares this week (three altogether since it first appeared on 18 July). The first of this weeks major flares occurred at 01:49 UT on 20 July. The event was rated a class X1.0/2N event located at N10E72. The event began at 01:25 UT, peaked at 01:49 UT and ended at 02:07 UT. Only a Type II event was observed with this flare (at 01:53 UT). A tenflare of about 230 sfu was also observed with this event for approximately 41 minutes. The second major X-class flare occurred two days later on 22 July at 10:03 UT. This flare, also rated a class X1.0 x-ray event (optically rated a 2B), began at 09:46 UT, peaked at 10:03 UT and ended at 10:13 UT. It was associated with a major Type II sweep and an importance 2 Type IV sweep at 10:03 UT and 10:22 UT respectively. Located at N09E43, this event was a greater geoeffective threat, but failed to produce any terrestrial impacts.

Region 6734 continued to grow early in the week and should be near its maximum size now. Early in the week, this region had a beta-gamma-delta configuration. It has since lost the gamma configuration, but is still a potent region with a small delta and strong magnetic fields. Region 6741 (just east of 6734) also contains a small delta configuration and is a healthy active region.

Geomagnetic activity this week ranged from active levels to quiet levels. High latitudes experienced residual minor storming early in the week due to several departing coronal holes, but have since become more dormant. No significant storm periods were observed. The impact originally expected from the last X-class flare of 22 July failed to materialize. Impacts were expected to be mostly low. A sudden magnetic impulse was observed at 19:02 UT on 20 July and was followed by generally active conditions (to minor storm conditions over the higher latitudes) throughout most of the UT day of 20 and 21 July.

HF propagation conditions have been fair to very good over the middle and low latitudes. Fair conditions were observed early in the week and over some areas on 20 and 21 July. Conditions began to improve thereafter (with some reported degradation over Australian regions later in the week - possibly correlated with periods of localized substorming). Conditions have been better than normal for much of the latter part of the week due to a lack of SWF's (M-class flaring has been less frequent than expected), declining geomagnetic activity and increasing solar indices.

VHF propagation conditions have been generally normal. Ionospheric conditions have not been particularly favorable for backscatter or auroral-induced activity. Several enhancements were reported in conjunction with the major X-class solar flares which occurred earlier this week, although these enhancements were rather brief. Night-side HF enhancements also appear to have been correlated with at least one of the major flares.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity is expected to range from low to high this week. There is still a good possibility for another major flare erupting from Region 6734 and possibly from Region 6741 as well. Occassional M-class flaring is also expected this week, although the frequency of the flaring is not expected to be as high as was originally predicted. At the present time, the majority of the flare activity should be confined to the C-class levels. Approximately 0.5 to 1 M-class flares per day may be observed, until the other active centers begin to rotate back into view around the east limb. Thereafter, M-class flaring may increase in frequency somewhat.

Geomagnetic activity should remain generally quiet to unsettled throughout the next week, barring potential impacts from major flares. Recurrent coronal effects may begin to impinge on geomagnetic activity after about 01 or 02 August. However, confidence levels are not particularly high due to the uncertainty of major flaring. Should Region 6734 (or one of the cluster of regions now near the central meridian) produce a major flare, geomagnetic activity could become much higher than what the forecasts predict.

Auroral activity should remain generally dormant throughout this week, barring major flares. A risk of potentially significant auroral activity could occur if a well placed major flare should erupt. In the absense of major flares, auroral activity should remain non-visible from the northerly middle to the low latitudes. Only faint to low intensity activity should be observed over the high latitudes, until after approximately 01 or 02 August. Thereafter coronal effects may increase auroral activity over the high latitude and northerly middle latitude regions. No auroral storming is expected at this time. Lunar phase will inhibit attempts to view activity.

HF propagation conditions may be better this week than they have been in the last month (or possibly two). Barring major solar flares, the combination of relatively high solar indices (the peak will occur this week), low geomagnetic and auroral activity, stable ionospheric conditions and relatively infrequent M-class flaring (sources of SWFs) could provide very good propagation conditions over all HF bands. Signal strengths and

stability should be above normal this week if flare activity remains relatively low. Night-time propagation conditions should also be good to very good over the low and middle latitudes. The high latitude regions should experience generally good to fair propagation conditions, as well.

Local MUFs may surpass 40 to 45 MHz over some locations, bringing a slight possibility for localized openings on 6 meters. VHF bands should otherwise remain mostly normal and DX-quiet this week, except during possible periods of sporadic-E or meteor scatter. No significant opportunities for VHF backscatter are expected, barring major flare eruptions.

Watch for possible future alerts or warnings.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 26 JULY

CONFIDENCE LEVEL: 65%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

Cumulative 60 day Solar Activity Record
Start Date: May 27, 1991

NOTES:
Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be expected for related solar flux values. Plot lines labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

NOTES:
These VHF DX prediction charts are defined for the 50 MHz to 220 MHz bands. They are based primarily on phenomena which can affect VHF DX propagation globally. They should be used only as a guide to potential DX conditions on VHF bands. Latitudinal boundaries are the same as those for the HF predictions charts. For more information, request the document "Understanding Solar Terrestrial Reports" from: "Oler@Hg.Uleth.Ca" or "COler@Solar.Stanford.Edu". This document, as well as others and related data and forecasts exist on the STD BBS at: (403) 756-3008.

1322. Re: Ham Shack Weather Station Experiences/Opinions Solicited

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-26 05:25:01 UTC
From: cjackso@uswnvg.UUCP
Message-ID: <1005@uswnvg.UUCP>
Source record: 295033

separately priced sensors and the tech manual for $500 (kit). I don't think I'd buy it again. It was by far and away the HARDEST kit I've ever built (and I have about 20 years exp building Heath and other kits, including an Altair and a Heath H-8). Unless they've improved, the kit building docs are the worst I've ever seen out of Heath (poor graphics, poor mechanical, outright ERRORS - even after 7 sheets of corrections). The calibration procedure was designed by a sadist - I had to do it 5 times to get close, and a friend had even more trouble. I'd say that if you can get a fully assembled and tested copy for what I paid for mine, you probably have a deal - otherwise, no way.

And Heath USED to build good stuff....

>I don't know what happended.
>
I think the overseas rate is 50 cents (ex VE/XE) and that is where they get the
50 cents number on the IRC trade in value. (At least thats what the latest
IMM (IMM $14.00 739-004-00000-4 twice/yr US GPO) says!)

The IMM is the International Mail Manual (a semi-annual subscription publication
with all you ever wanted and surely didn't want to know about US->overseas mail)

1324. Wristwatch transducer (for setting frequency)

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-26 09:40:53 UTC
From: monta@image.mit.edu
Message-ID: <MONTA.91Jul26044053@image.mit.edu>
Source record: 295044

Jeff B. Later writes:

> I don't have $10K to spend on a special "frequency counter" made exclusively
> for adjusting accuracy of quartz watches.

I set my watch's frequency using signals capacitively coupled from the LCD display. This works pretty well---it takes only a minute or so to set it to a part in 10^7. (At this level, with uncompensated crystal oscillators, the limits are set not by the accuracy of the initial trim but by temperature variations and mechanical shock.)

Here's how to do it. Make a high-input-impedance buffer (with a FET op-amp, for example); establish input DC bias with a large resistor (10 megohms); then couple to the watch with a short piece of wire, perhaps six inches, placed in close proximity to the LCD. I make the wire into a circle and tape it to the watch face.

Now look at the output. At least for my watch (a Casio W-720), there are little spikes at a repetition rate of 32 Hz, presumably the LCD segment signals. Synthesize 32 Hz from your frequency reference (I use an ovenized crystal periodically trimmed to Loran-C, which gives me part in 10^9 accuracy, overkill for this application; you can also use frequency counter or radio reference oscillators). Trigger the scope on the 32 Hz reference; the wristwatch signal will now remain almost stationary. Slew the reference signal until one of the watch pulses is near the left side, then set the scope to, say, 1 us per division. Now it's just a matter of tweaking the trimmer capacitor inside the watch until the pulse stops drifting.

You may want to do all this while the watch is still warm from your wrist---with this setup it's easy to see the frequency vary with temperature.

1325. Re: post-mixer amplifier

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-26 10:18:52 UTC
From: rutgers@cst.prl.philips.nl
Message-ID: <rutgers.680523532@cstw32>
Source record: 295057

Right, we (PAoSU and ON7TI) measured a SRA 1 H before a common gate P8002 with-
and without a diplexer..... NO DIFFERENCE. The chaps of Collins and R und S
however put a diplexer between such amp's and the mixer and that is what I
do'nt understand.
By the way, which signals are in-band signals depends on the preselector!
A good preselector lowers the chance of IM-products, DO'NT FORGET THIS!!!
73, Herbert.

1326. Need names for Kenwood service centers

Newsgroup: rec.radio.amateur.misc

1327. IRC and Green Stamp explained

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-26 12:55:37 UTC
From: vbreault@rinhp825.gmr.com
Message-ID: <59635@rphroy.ph.gmr.com>
Source record: 295050

Many thanks to all my net.elmers that answered my question regarding
the definition of IRC and Green Stamp, their use and redemption.

Briefly: A green stamp is a US Dollar Bill
An IRC is an International Reply Coupon

IRCs can be bought at a post office for <= $1 and can be redeemed in
any participating country for one unit of first class postage. These
are safer to use than hard currency when sending QSLs to countries where
the mail may be tampered with.

US dollar bills are usually pretty swell things to have, but their
possession used to be (and may still be) a felony in come countries.

1328. Post-mixer amplifier.

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-26 13:12:40 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <26.Jul.91.14
Source record: 295052

When i built a system using a DBM, i used selectable attenuator pads
on the LO and output ports. Its easier to optimise your LO injection
by designing for much more than you need, and attenuating it in a
pad, than to try designing variable-gain LO amplifiers that retain their
linearity at different gains...
Also i put a 4-stage helical filter between the LO and the pad, so it
looked like:-

OSC-->Buffer-->Multiplier-->Amplifier-->filter-->pad-->DBM

(This was for a converter to take 144MHz down to a 24-28MHz IF)

I used 4 sub-critically-tuned coils in the frontend, no RF amplification
at all; also a 3dB pad between the DBM output and the pre-filter amplifier;
this makes sure the DBM is terminated in its proper impedance over the whole
of its working frequency-range. If you are using square-wave LO drive
(like you should...!) then you have a complex series of mixing products;
impedance matching at the IF frequency may actually reflect energy at
other frequencies back into the LO output port of the mixer, degrading
its performance.
In my application, strong-signal handling was the most important thing; i
was operating 1/2 mile from a FM b/cast TX with an ERP of approx 1/2
megawatt, and got several volts of RF at 89.1MHz across my 2-meter beam...
i could light a small filament bulb by connecting it to an 8-ele 100MHz
beam and pointing it at the TX..... *this* sort of thing puts a whole new
meaning to 'strong-signal capability'...!

Pete Lucas G6WBJ Politically INcorrect... and proud of it!
PJML@IA.NWL.AC.UK@UKACRL The World is such a mess it can only

1329. How do RDF antennas work?

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-26 13:13:51 UTC
From: dube@cpdvax.CSc.ti.COM
Message-ID: <9107261313.AA19131@tilde.csc.ti.com>
Source record: 295053

I missed the first of this thread, so this has probably already been mentioned.
There are two antennae involved: a loop and a sense antenna. The loop seeks the null (which can be two places 180 degrees apart), and the sense antenna signal
is used as a phase ccomparison to eliminate one of the null points. A motor drives the loop to a null and a selsyn system drives the indicator in the cock-pit. In cases where the indicator is 180 degrees off, I can think of two possibilities. One is that the sense antenna got disconnected. The other is that (for the incident in Finland) the Russkies were still playing games. They have been known to transmit on the same frequencies as other Nav-aid stations to misdirect aircraft. It was used extensively during the days of the Berlin blockade, and from time to time since. The practice has a name, but I forgot what it is. Maybe it was "farking" or some such.
73,
Dube N5PDK

1331. Re: Radio Shack 2 Meter

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-26 14:02:02 UTC
From: M14494@mwvm.mitre.org
Message-ID: <1991Jul26.141309.1299@linus.mitre.org>
Source record: 295056

Thanks for the info. The thing that may well save us all is that the average HT today is *much* too complex for the average CB yahoo to operate. I've been a ham for 30 years with an Extra class license, have degrees in Physics and Engineering, and there are buttons on my FT-470 that I *still* don't understand after two years! Confronted with the thirty or so interdependent functions on the keyboard of an HT, the typical pirate bozo would, I think, give up and go back to his CB set: On-Off-Volume and Squelch are probably about it for them!

1332. Heathkit - Gone?

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-26 15:44:00 UTC
From: jimallen@hpcuhb.cup.hp.com
Message-ID: <60950005@hpcuhb.cup.hp.com>

I just recently noticed that the local Heathkit
store "went away." Someone told me that they are
strictly mail order now. Is this truly the case?
Also, they may be out of the Ham Radio buisness.
Is this true? Is there a retail Heathkit outlet
in the SF Bay Area?

Thanks,

Jim KC6VWV

I want to know when our government is going to catch up to the twentieth
century so we can just access the FCC database.

>No one is suggesting that
>Curtis has to give away code *unless* they want to get paid for the article.

An article's purpose is twofold: first and foremost is to inform -
that's what magazines are for. I think of the proprietary part as a
surcharge paid to the author by anyone that wants to actually build it.
The author usually gets support calls, too.

There is a fine line between advertising and product descriptions. When
was the last time anyone saw full blueprints for a house in the Sunday
paper ?

>I design/construct circuits. I write/compile software. What's the difference?
>Why is a program "wetware results" yet a circuit diagram is not?

The primary difference between hardware and software is the ease of
duplication. Since software is the most unique component, it is more
likely to be made the proprietary part. Other aspects of hardware and
software development such as design and test are similar, although the
toolset differs.

>The issue is that *construction* articles should be complete or
>they should be called something else.

If you have a problem with the label "construction article", think of a
better phrase. I view the QST articles as a compendium of research
results - just like any other technical journal. As such, they are only
a jumping-off point for other projects. (Do the editors of QST actually
expect us to build this stuff ?!?) The articles' real value is in
illustrating the underlying concepts.

This makes QST articles a cut above just simply going to a store and
buying a "some assembly required" electroproject. Hams have a tendency
to do things their way, so leaving holes in the details is not such a
crime.

850 to 869 is not cellular. 869 to 894 is. 894 up is not.
It's not illegal to buy/sell/advertise 800 Mhz radios. It's illegal to
pass along what you hear in certain cases (1934 law) and the ECPA
says listening to cellular and some other things is illegal.
Unfortunately, no one understands exactly what ECPA says but then
unless you do something really bad no one is likely to cause you
problems. Get the scanner and go hide in your closet to listen.

It's amazing how everyone has reinvented the wheel.

I use a file of record offsets into the main database file. I then create index files that sort record numbers, depending on which field I want to look up. Using these two files, I then wrote a routine that is used by bsearch(3C).

I suppose the next step is to Huffman the records, keeping the final <CR> in place. One way I compressed the file was to eliminate the records that were not that interesting, like previous callsign and date-of-birth. I see now that was a mistake: it prevents implementation of "geezer alert". :)

>The International Reply Coupon that you send to a ham overseas can be exchanged
>for postage stamps in his or her country. As I understand it, in the USSR
>one IRC can be exchanged for the equivalent surface-mail postage rate
>to America, while 2 IRCs can be exchanged for air-mail postage to America.

Another point that not everyone is aware of: NEVER redeem an IRC yourself! Either resell it to a DXer or use it to send to a DX station!

Likewise you are much better off buying a stock from someone who has just been QSL mgr. for a DXpedition (or DXer) than from the post office. Typically they sell for about half price in 100 quantities - not too much if you are actively pursuing DX!

The "redemption rate" of an IRC varies by country. ONE IRC is good for first class surface mail rate which may take as long as a year to arrive. Air mail redemption rates vary from country to country, check a recent Callbook for up to date info on this. Some countries require as many as 5 (!) IRCs for air mail. A "green stamp" (or TWO!) is definitly in order for those countries.

As for DX stations making a "profit" from this, remember that the US has one of the LOWEST international mail rates in the world and the DX station probably works/gets as many as 1000 QSOs/QSLs a month. At $1-$2 each it doesn't take a genius to figure out why they want YOU to pay postage!

ALWAYS remember that THEY don't need a U.S. contact, YOU need them!

OH yes, as the first poster pointed out, a few words in THEIR language is worth about 100 IRCs/green stamps. I recommend the "DXers Phrase Book".

>My only measuring device at present is an el cheapo AC/DC meter.
>After wiring up the aforementioned circuit, I measured a little
>over 3 vdc and around 4 vac (RMS). Thatsa some ripple, I think.

Since the transformer is 6.3v (rms), and you're only taking half
the wave, 3v (dc) is reasonable. You may want to use a fullwave
bridge if the coil doesn't have enough voltage across it to fire,
or the capacitor trick (below) doesn't work.

>My question (to end this installment of my exciting series) is:
>would this be enough dc (scrambled though it is) to power the
>relay, or will I need to filter it further (perhaps using a simple
>circuit I came across in the Beginning Fool's Guide to Most Basic
>Electronics)?

Relays are also mondo inductors, so you already have a little filtering
there. If there isn't some capacitive filtering, the relay can buzz at
60 Hz, which can be annoying. It may also buzz the contacts at 60 Hz,
which wouldn't be nice for RF. I would try various values of capacity
(start at >5 uF) out of the junk box until the hum was tolerable. Put
the capacitor across the relay coil.

This increases the average current through the relay coil. It also
increases the peak current through your diode. I suggest using a real
power diode, like a 1N4001.

<Original posting asked why some commercial receivers use a diplexer at
the mixer output when the post-mixer amplifier already presents a good
broadband 50-ohm match.>

I think the answer is that you are right, if the third-order intercept (TOI)
of the amplifier is substantially greater than that of the mixer, referenced
to its output, then the diplexer is superfluous. The diplexer wouldn't do
anything that filtering after the amplifier would do.

>Still no answer to the question.... If I use a good preselector there is no
>need for selectivity there. The only unwanted signal is the oscillator residue
>which does not boarder seeing the results (third order IP > 30 dBm).

>By the way, the U310 offers a slightly worse match to the mixer than a P8002
>because of less isolation of the fanciful impedance of the Xtal-filter (XF9B)
>from the source input impedance.

The input impedance of any grounded-gate JFET amplifier is a function of the
load impedance. I derived this a long time ago. If I remember correctly,
for resistive loads, the input impedance is (1/Gm) * (RL/Ro) where
Gm is the transconductance, RL is the load impedance, and Ro is the
common-source output resistance. A U310 (or J310 plastic package equiv.)
has a typical Gm of 17 mS so the input impedance is around 59 ohms times
the ratio of load impedance to output resistance (about 4 kohms).

For an input impedance near 50 ohms, you either need to maintain a low
load impedance or go to a cascode amplifier.

>
>To paraphrase, if you're planning on getting rich by publishing articles and
>getting paid for them, you're wasting your time.

No one is suggesting this. However, just as with the so-called shareware s/w, it is nice to think you might recoup some of the investment you've made in time, energy, and materials. As it happens, some folks carry this on to the point where they can make at least a supplimental income. Is there something wrong with that?
>
>The issue is that there is essentially no difference between circuit diagrams
>and programs. The issue is that *construction* articles should be complete or
>they should be called something else.

If you can buy the parts from a vendor, assemble it according to printed instructions, and have it work without undocumented external support, I'd submit it is a construction project. This keyer meets those qualifications. I've seen it put together and working; assembled by folks who haven't got the slightest urge to know what is on the chip in code terms. This is not software you can casually key into your pc to empower external circuits (a la' PMP or Baycom). Programming this chip is possible for those who want to do it, wheather the authors publish their code or not. On the other hand, constructing the keyer is possible even if you've never blown a ROM in your life. (NO, it's not a ROM--sheesh.)

I too am not happy when there is only one vendor for a part. In this case, the rub is that the part is available elsewhere sans code. If you pick that route, your construction job is harder, but still do-able. I've been in the position of having people call me (at all hours) to have me produce a certain item. They occaisionally offered to pay for materials. Mostly I had to ask. And postage? Sure, but does that box REALLY cost so much, huh can't you ship it to me cheaper (or faster or ...)? And (no, can it be true?) some people never got around to sending any money at all. (This was not ham related, and I'm not going to repeat the experience!). So.. I don't blame the authors for turning to a vendor who was willing to take over this chore. Should we fault ARRL for accepting an article that required a "custom" chip? If so, a very useful design, whose parts are of moderate cost, would be lanquishing on the back pages of ham magazines in small print ads. Oh, but how about public domain? If the system were better and the abuses less, maybe.

Not too many months ago there was a lot of griping about the lack of new construction articles. After this keyer design was published, the net had quite a few enthusiastic builders raving about it. Now it's around to the griping "NO program included? Bash the authors. Bash the magazine!". Come

on! My 14 year-old (N5SVU) saw the article and (for the 1st time) said something to me about trying to do that. Remarkable. Have you shared this idea with youngsters in your club? I've got a friend who didn't have a keyer till he saw this one and could afford those parts. What do we what anyway?

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space and rec.radio.amateur.misc. This week's elements are provided below.

1346. Tandy Address

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-27 06:37:00 UTC
From: WILLIAMS@gamma.IS.tcu.EDU
Message-ID: <3CCD5F667BAD000176@gamma.is.tcu.edu>
Source record: 295063

Since I'm in the Tandy Home of Fort Lucky (Ft. Worth), I thought I'd pass the address along to all those concerned about the selling of HT's to unlicensed customers... (a brave thing, since I myself am now working on my code) ((kudos! kudos!))

Tandy Corporation
1800 One Tandy Center
Fort Worth, Texas 76102

These are the executive offices. Use at your own risk.

73's,

Mark Williams

1347. Please help with tower question

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-27 15:43:29 UTC
From: joseph@panix.com
Message-ID: <1991Jul27.154329.19699@panix.com>
Source record: 295073

Well, I posted this before, but didn't get any help.
Maybe this time. Thanks.

A friend has a 70 foot tower he want to get rid of, and offered it to
me at a good price. I'd like to take him up on it, but am a little
weary on how to erect it, and how to instal and maintain antenna's on it.

I know I need to make a concrete foundation, and it will be attached, at
about 20 feet, to the top of the house, but how do I tune the antenna
once the tower is up?

I don't know the manufacturer, but the tower comes in 9 to 10 foot
sections, each of which consists of three legs forming a triangle with
braces between them all the way up. The legs are 12 1/2 inches apart.

I climbed about 20 feet up as it stands now on (on my friend's property),
and I'm unsure if it can hold me (200 or so lbs.) all the way up.

Are these types of towers made to have people climb to their top?
Do I need to make some sort of hinge at the base to tilt the thing
down each time I want to install/tune an antenna?

How do other people work with them?

Thanks a lot,

Joseph R. Skoler

Jim (KC6VWV, jimallen@hpcuhb.cup.hp.com) asks:

>I just recently noticed that the local Heathkit
>store "went away." Someone told me that they are
>strictly mail order now. Is this truly the case?
>Also, they may be out of the Ham Radio buisness.
>Is this true? Is there a retail Heathkit outlet
>in the SF Bay Area?

Heathkit has retired from the ham radio business. I got a catalog from them several months ago. Many items were discounted. When I called to place an order, the salesperson told me Heathkit is finished with amateur radio for good. They are still in the home automation business, so you can still buy home security systems and such. Incidentally, all items I wanted were sold out. I was very disappointed.

As for Heathkit outlets in the Bay Area, the only one I know of is in Redwood City. It's right across the street from Price Club, at the corner of Woodside and Middlefield. Look for a Zenith computer store. When I asked about their Heathkit products, the salesperson told me they have to order it from the warehouse, and it's not cheaper than mail order. I recall that at that time, I decided that mail order is actually faster than going through the store.

Why is everyone so freaked out about Tandy selling Amateur Radio gear?

Go to NYC and visit the electronics district, welcome to the land of gray market doo dads. Anyone can buy anything there.

I am all for Tandy selling Ham Gear, at least it will be moderately priced, easily repaired, and backed by a US company.

I hope it scares the hell out of the BIG THREE and they get off their ludicrous pricing structures and make selling their products easier.

I'll bet that when a mass marketing company like Tandy or Sears starts selling full lines of ham gear, we'll get better prices, better product, and a lot less headaches when it comes to servicing the equipment.

Remember, with more hams, we have a bigger voice in regulation and de-regulation...some of you old farts won't be able to deal with this since Amateur radio has been (up till about 5 years ago) a closed fraternity, but I feel that overall it will help strengthen us as a group.

send flames to /dev/null Dev needs the mail.

Antenna Raising Incident or, we should all learn to take that vacation we so well deserve.....

To: The Bureau of "Waddamagonnadonow?:"

I'm writing in response to your request for additional information for Block Number 3 of the Accident Reporting Form. I put "poor planning" as the cause of my accident. You said in your letter I should explain more fully, and I trust the following details will be sufficient.

I am an amateur radio operator and on the day of the accident I was working alone on the top section of my new 80 foot tower. When I had completed my work, I discovered that I had, over the course of several trips up the tower, brought up about 300 lbs of tools and hardware. Rather than carry the now unneeded tools and material down by hand, I decided to lower the items down in a small barrel by using a pulley, which fortunately was attached to the gin pole at the top of the tower.

Securing the rope at ground level, I went to the top of the tower and loaded the tools and materials into the barrel; I went back to the ground and untied the rope holding it tightly to insure a slow descent of the 300 lbs of tools. You will note in Block Number 11 of the Accident Reporting Form, I weigh only 155 lbs.

Due to my surprise at being jerked off the ground so suddenly, I lost my presence of mind and forgot to let go of the rope. Needless to say, I proceeded at a rather rapid rate of speed up the side of the tower. In the vicinity of the 40 foot level, I met the barrel comming down; this explains my fractured skull and broken collarbone. Slowed only slightly, I continued my rapid ascent, not stopping until the fingers of my right hand were two knuckles deep into the pulley.

Fortunately, by this time, I had regained my presence of mind and was able to hold on to the rope in spite of the pain. At approximately the same time, however, the barrel of tools hit the ground and the bottom fell out of the barrel. Devoid of the weight of the tools, the barrel weighed approximately 20 lbs. I refer you again to Block Number 11. As you might imagine, I began a rapid descent down the side of the tower. In the vicinity of the 40 foot level, I met the barrel coming up; this accounts for the two fractured ankles and the lacerations on my legs and lower body.

The encounter with the barrel slowed me enough to lessen my injuries when I fell on to the pile of tools, and fortunately only three vertebrae were cracked. I'm sorry to report, however, that as I lay there on the tools, in pain, unable to stand, and watching the barrel 80 feet above me, I again lost my presence of mind. I let go of the rope.

Sincerely and shaken,

Dunlego Megone

SB DX @ ALLBBS $KT7H207
RTTY DX Notes 1of3 7/26/91
RTTY DX Notes for week ending 26th July 1991
BID: KT7H207
Part 1 of 3.

>From information received, we believe that there are moves to change
the present AMTOR system with variations in several forms. Some stay
close to the original, while others diverge into a different line of
thinking.

First, a hybrid packet/AMTOR system, while it appears at first to be
fairly good, seems to have some fundamental possibility of difficulty.
It is called Pactor.

Then we have the BMKMULTY mode. This is a fairly clever system done
in software, but you still need a modem. It will even send 600 WPM
Morse. I don't really think I could copy that.

Both these systems are to speed the transfer of traffic, but they give
no real relief for long haul work.

Then there is the half block system. This stays with the present
AMTOR system, with the exception that the receive block is extended so
that communication on ARQ mode would be possible around the world.
Now that makes sense.

It is good to see experimenting going on. It at least shows that
someone is trying to improve the communication systems.

Our thanks this week go to CE3GDN, I5FLN, K4FJ, OD5NG, TG9VT, UT5RP,
VK2EG and W2FG with the Tri-State DX Packet Cluster Network. Thank
you all for your assistance and good information.

Continued in part 2.

QSL Information.

RA1AW collects his cards from Box 159/27, Leningrad 198215.

KE0YG/TF says to send his cards to his home call, or to
Lt. J.G. Randal Jaques, Box 27, U.s. Naval Air Station, FPO New York, NY 09571.

V47RF cards go to N5FTR.

5W1CW is Ron, ZL1AMO when he is at home.

RJ1S/UI9GWA says that he collects his cards from Box 15, Ferghana
712000 USSR.

Notes of Interest.

HB9DCQ reports that he will be going to South Cook Islands (ZK1) this
coming week, though suggestions have been made that since Ron ZL1AMO
has just been there, it would be a good idea for him to go to C21 for
a short period. No response so far.

9X5LJ will be QRT until September 4th.

4K5ZI (Snake Island) say they have no RTTY gear with them this trip,
but will return next year and will be fully equipped. The country
status of Snake Island is not clear at the moment, just hope for the
best.

GL DE DX1.

From: duncan@bolero.ati.com
Message-ID: <29972@bolero.ati.com>
Source record: 294928

In article <54420025@col.hp.com> kenw@col.hp.com (Ken Wyatt) writes:
>Try "TNC", a common connector for cell phone antennas. Radio Shack sells
>an adapter that goes from TNC to BNC.

I just bought one of these last Tuesday for my Panasonic TP500
transportable phone. While it did basically work, I chose not to use
it because the dimensions of its outer conductor allowed the adapter to
jiggle around too much on the phone's TNC female connector. I figure
that a few weeks of this will eventually ruin the connector so I took
off the adapter and threw it in my junkbox. This TNC/BNC adapter would
be quite convenient, but I recommend looking elsewhere for it.

Source record: 294932

sdd.hp.com!caen!nstar!towers!brian@ucsd.edu Brian Murrey - KB9BVN writes:

>Why is everyone so freaked out about Tandy selling Amateur Radio gear?

They are expressing what they feel is a valid worry about unscrupulous sales techniques that have been observed by salesman working at Radio Shack that might result in mass sales of these radios to unlicensed parties. There could be some uncontrollable fallout that the FCC is not likely to participate in cleaning up.

>Go to NYC and visit the electronics district, welcome to the land of gray
>market doo dads. Anyone can buy anything there.

True, but it is not a U.S. mass marketing outlet, thus there is a difference.

>I am all for Tandy selling Ham Gear, at least it will be moderately priced,
>easily repaired, and backed by a US company.

Probably not made by a U.S. company though, and in my personal experience Radio Shack // Tandy is not always so good in the servicing, pricing, nor backing either. But that is simply a personal view and may be localized to this area. I hope you are right.... seriously.

>I hope it scares the hell out of the BIG THREE and they get off their
>ludicrous pricing structures and make selling their products easier.

Would be nice, but I doubt that there will be a mass flocking of hams going to Radio Shack to buy their gear in preference to the big three. This would be the only thing to really make an impact and I doubt that it will occur. Again, I wish you were right, I just consider it unlikely.

>I'll bet that when a mass marketing company like Tandy or Sears starts selling
>full lines of ham gear, we'll get better prices, better product, and a lot
>less headaches when it comes to servicing the equipment.

Then why isn't Ten Tec the number one seller of amateur equipment in the U.S.A.?

>Remember, with more hams, we have a bigger voice in regulation and
>de-regulation

This is true, but the worry is that radios may be easily put into the hands of UNLICENSED individuals and the resultant fray if this were to happen would do anything BUT help the cause for amateur radio. Although honestly I do not think it will be all that bad, you can be sure that it IS going to happen at a higher rate than it presently is now. There are other factors than pure "numbers" that can influence our horsepower when dealing with other people that control the outcome of amateur radio.

>...some of you old farts won't be able to deal with this since
>Amateur radio has been (up till about 5 years ago) a closed fraternity,
>but I feel that overall it will help strengthen us as a group.

Actually, the control of the radio market by the "big three" is something relatively recent when compared to the total history of ham radio, but I wouldn't expect youngsters like you to remember that. Of course I am only 38 and it is rather an awful thought to consider that this now makes me an "old fart". A little sarcasm... sorry ... it slipped out! :-)

Personally I do not think that our opinion is going to make any difference in whether Radio Shack // Tandy sells, or does not sell Amateur equipment. And the fact is that Motorola sells radios to anyone with the cash, so why not Radio Shack? The difference is that Motorola is not located in every major shopping mall nor does it cater to the masses. So there is a POTENTIAL for some "bad things" to happen, but I am sure that our ability to track down, identify, turn-in, and then see prosecuted violators of FCC regulations will save us all from any bad things. Right? RIGHT?? :-)

I think that what really is at issue here is that the majority of hams have some respect for their licenses and the laws that govern their use. They would have liked to just get everything for nothing but they resisted that temptation and obtained a license and the resultant privileges legally. People like this get nervous when it appears that this process can become easily circumvented and that it could all get totally out of control. This scenario is unlikely, but some aspects of it could easily happen so I do not think that it is unreasonable to discuss it. After all, that's all that we actually do here anyway right? Just talk about things?

>send flames to /dev/null Dev needs the mail.

Agreed.

RACESBUL.180 DATE: July 29,1991
SUBJECT: WHAT IS A "SHADOW"? - Part 2/2

EQUIPMENT REQUIREMENTS:

The shadow shall furnish the following
equipment when reporting for duty:

(1) Hand-held, 2 meter, 5 watt output, synthesized
transceiver with programmable CTSS encoder. (Note Cross band,
dual band, 2 meter-440 radio recommended and will be required in
the future.)
(2) Mobile 2 meter radio for easy installation in a vehicle,
including mag-mount antenna. Alternative: mobile booster
amplifier. An external with a long cord is also required. (See 2
meter-440 note above also applies).
(3) Earpiece or headphones for HT, or speaker-mike.
(4) Spare batteries for 24 hours operation.
(5) Power adapter connectors -- both cigarette lighter and
clip-lead for direct battery connection with cables at least 10
feet long. Recommended: Anderson Power-Pole connectors.
(6) 5/8-wave,mag-mount antenna with 15 feet coaxial cable AND
extendible pull-up antenna for the HT, as well as the regular HT
rubber duck antenna.

RACESBUL.179 DATE: July 22, 1991
SUBJECT: WHAT IS A "SHADOW"? - Part 1/2

Question: What is a Shadow?
Answer: A shadow is an Amateur Radio operator who accompanies an official during an incident. The following is from the Nevada-Yuba-Placer Ranger Unit of the California Department of Forestry and Fire Protection, sometimes abbreviated simply as the CDF:

CONCEPT:
(1) The purpose of the shadow is to allow constant contact with some person who is important to the fire operation. Thus the ham operator MUST remain in the immediate vicinity of the person shadowed AT ALL TIMES.
(2) Because the person being shadowed will usually be involved in some important activity, the shadow should be
More[Y,n,c] unobtrusive in the vicinity of the person, interjecting only communications is needed.

RESPONSIBILITIES/DUTIES:
(1) Communications
(a) The shadow operator must remain with the person being shadowed at all times. In addition, the ham must monitor the radio AT ALL TIMES.
(b) Operator is expected to take direction from the site supervisor during his shift.
(c) The shadow may operate other radios as well, such as the departmental radio and cellular telephone.
(2) Shift Durations. Most CDF operations have shift durations of 12 hours at a time. This time may vary depending on the actual needs of the operation.
(3) The operator shall be in good physical condition. The ham operator must be able to walk and sometimes run long distances with the official.

(to be continued in part 2 of 2 parts)

Hey... these things happen. I remember reading about a similiar
accident when I first got in the two-way business, back in 1973. I've
got into similiar misshaps myself, workers compensation picked up the
hospital bills--Hammers don't have it so lucky.

Hmm.. two knuckles deep into the pulley.

Source record: 294936

Don't be silly, of course there is. The instructions to disassemble the thing are found in Popular Communications 3/89 p26. It is not that complicated, but there are some photographs and specific instructions. I'll just tell what the mod is, and if anyone needs more specific directions, well, maybe I can post them or send a copy of the article.
Once you get everything apart, clip the lead on D11. D10 is next to it, and be careful not to cut it. D11 is the diode closest to the bottom edge of the board.
I also have the mods for 2004,2005, (maybe 2006, I'd have to check), and Bearcat 200XLT.

There is still another reason to use IRCs in some countries:
changing that $1 to local currency would cost at least here
more than just that $1..

Or maybe it's not so bad idea after all.. maybe it is just
better to keep those 1 dollar bills & send them back one by
one :-)

1363. Software to model RF cavities.

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-28 20:08:12 UTC
From: ed@orca.cynic.wimsey.bc.ca
Message-ID: <9107287699@orca.cynic.wimsey.bc.ca>
Source record: 294940
Cross-posted to: rec.radio.amateur.misc,sci.electronics

I am interested in obtaining IBM DOS software, which models radio frequency cavity band-pass and reject filters used in the two-way radio industry. Source code would be nice.

There are simple formulas that calculate the insertion loss at various frequencies off resonance, but I need a more detailed model, which includes stubs and the connecting transmission line coaxial cable sections. The model should output insertion loss, return loss, reflection coefficent, real and imaginary impedances.

I realise that a true model of the cavity would require the services of a Cray super-computer, but hopefully there are simplified models that will serve my purpose.

Any suggestions would be appreciated, such as the names of commercial or shareware software. I have a limited budget.

Thank you for your help.

You can duplicate sofware of this type with an eprom programmer.
You can duplicate hardware of this type by photocopying the article.
I've developed both. I fail to see the difference with regards to
a construction article. Note that if QST had published the code
you would of got it as well with the photocopier.

>
>
> >The issue is that *construction* articles should be complete or

Holes in the details? I haven't seen the original article (QST irritates
me for some reason), but a keyer with a single chip micro in it wouldn't
really have any hardware to speak of. Not telling about the code would
mean the article wouldn't really of said anything.
>
>
> >Willis Marti / N5SZF
>
> Perry Scott / AA0ET

I admit that I might be a bit biased in my attitude. The idea that
the code isn't really needed to understand a software based
device is one that constantly haunts me in my day to day work.
I repair electronics. It's been years since any service manual
has even tried to give even a glimmering about the operation of
the code in even the most software intensive device. If you don't

understand the software you don't understand the device.

-around 900 mHz or so; are there several channels, like on cordless phones?

It might work. The one I have is not xtal controlled; you set the
frequency with a pot. The range seems to be limited to around 50 feet
between the pair, but a better antenna should help that. With mine, the
freq drifts all over the place, so you have to keep retuning.

In the same vein, you can do what I saw at a PC repair shop - take a
original mac case, put a fish tank inside it and make a MacQuairium.
The proprietor was selling them for $75 each. He had a large pile of
the old (original) mac cases.

1369. Alinco 560 Handheld

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-29 11:29:13 UTC
From: jay@zen.CAc.stratus.COM
Message-ID: <9107291129.AA03296@.pangbo.>
Source record: 294945

The revised manual for the Alinco 560 handheld is almost complete. If you wish to receive a copy that you know that you will be able to evaluate, please forward me mail. Along with your mail please forward me your telephone number. This has an easy to read format on DSQ.

If you have any interesting tid-bits for the 160 or 560 handhelds, please let me know so I can consider for the manual.

Thanks,

Jay Appell (KA1SNA)

1370. Military surplus gear.

I was wondering... whats the availability situation in the States regarding ex-military HF and VHF gear? The supply of this sort of stuff seems to have dried up here in the UK over the last couple of years; i guess we sell all our used military radios to other countries now. And who are the major manufacturers/suppliers to DoD in the USA? I guess Rockwell-Collins, Harris etc. are still in there. Over here, the major suppliers are Racal, Siemens, Plessey, GEC/Marconi etc.

1372. Just getting started

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-29 12:17:39 UTC
From: kevin@noc.hfh.EDU
Message-ID: <9107291217.AA02897@snmpmgr.noc.hfh.edu>
Source record: 294946

I am just getting started and have obtained novice, technician and
general license prep materials. I have also obtained a book on building
wire antennas and plan to construct and erect my own. I have also
built myself a practice code oscillator and hooked it up to my key.
I would like to set up a shack, have a limited budget, but
am getting discouraged because all I see advertised in the few ham magazines
I have come across are equipment in the 900-5000 dollar range. I just want
to set up a simple multi-band CW station, and it seems that it is just too
expensive for an entry level person. I don't think I need a computerized
digital transciever, an analog one would do. Also what is the minimum
equipment required to set up such a station and how is it interconnected??

Any responses on this one would be greatly appreciated. Thanks in advance.

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 021 (OPDX.021)
July 29, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, ARRL Bulletin, DL6RAI, WB3JFS, KA3JWJ, WB3LHD, WK3N, W8GMH and WB8HIW for the following DX information.

ZA, ALBANIA (FACT, FICTION, RUMORS, MAYBE FOR REAL). Gee, I do not know where to begin with this one. I guess I will start with the Albanian Pirate. A station signing ZA1AP (AP stands for Albanian Pirate) has been very active this weekend. Both European and U.S. sources have heard this station say he is an Albanian Pirate. Also, it was reported on the Family Hour DX Net, that any callsigns issued from Albania would be a "ZA2" prefix. ZA1 prefixes are Military issued only. If this is true, than any ZA1 you hear on the air would apparently be a PIRATE! This information came from a German station that had been to Albania.
It was also reported, that a Helen, RB5WA, was on 21277.5 kHz saying a team of Hungarian operators will be operating from Albania, July 29th.
Almost on the same note as the RB5WA information, N0IMH and others on the Butterfly Net, on 14226.5 kHz, reported there will be a definite ZA operation next weekend starting August 2nd, 3rd or 4th. The licence is valid for 5 weeks and the operation should last for about one month. The length of their operation all depends on their funds. The operators are Hungarian, HA0MM and HA0NNN, will sign as ZA2QA. There are to be two stations on the air with beams and amps. QSLs are to be handled by Quick AID QSL Service, P.O. Box NR 5, Komoro 4622, Hungary (there is some conflicting info on this). Donations are to be sent to Ja'nos Bolyoczki, Eotvos u. 14, Nyiregyhaza H-4400, Hungary. Let's hope this is for REAL! KYFC!!

5W, WESTERN SAMOA. Ron, ZL1AMO, is now active as 5W1CW. Ron prefers CW, but will work some SSB. Check the following frequencies: 3799, 7004, 10104, 14022, 14165, 14252, 18076, 24906 and 28021 around the hours of 0000 to 0300z and again 1030 to 1200z.

FP, ST.PIERRE & MIGUELON ISLAND. This island should become quite scarce as Patrick, FP5DX-FP14DX, will be leaving the island in August. He has been quite active on 18120, 14241, 14200, 14030 and 7005 kHz between 2345 to 0330z. Pat will return to France and uses his home callsign which is F2DX.

KP5, DESECHEO. It was reported last weekend on the VK4OH Net that KP5, Desecheo will be activated August 23.

T5, SOMALI. T5RR showed up on 18160 kHz around 2030z this week. QSL via I2JSB.

TI9, COCOS ISLAND. Jeff, WB3JFS, had a QSO with Jose, TI2JJP, this past week and Jose told him he is planning to go to TI9 for about two weeks in mid-November. He is hoping to operate on all bands on SSB and CW. Also, Jose mentioned that his cards should be going out soon from the past expedition a few weeks back. Those who have not received cards from his other expedition should resend another QSL to TI2AOC. Jose is looking forward to operate from the island again, stating that he knows many people still need it, if not for a new one, maybe one for a new band.

YA, AFGHANISTAN. The Italian team made it on the air with the callsign T6AS. But due to weak signals and poor propagation, their operation did not satisfy the many who needed this for a new country. Unfortunately, the operators were ordered out of the country on July 21st. QSL to IT9AZS.

ZD9, GOUGH ISLAND. ZD9BV was heard saying there would be an operation from Gough Island around September 24th. The operator will be active on 6 meters, WARC bands, Packet radio and the usual SSB and CW. His call will probably be ZD9CP, although this has not been confirned yet.

ZS9, WALVIS BAY. Ian, ZS9A, usually can be found between 28610 to 28615 kHz around 1430 to 1630z. QSL via ZS1IS.

DXCC NEWS.....
It was announced this week that both 3X1SG and 3X1AU are now acceptable for DXCC credit. Documentation that was sent by QSL Manager ON6BV was reviewed and accepted by the DXCC staff. DXCC credit is effective immediately and those who had their cards returned may resubmit them with their next endorsement.

THE WK3N WORLD DX NEWS REPORT.....
HZ/7Z+4X4=-4U?? The oil rich Kingdom of Saudi Arabia offered to suspend a 40 year economic boycott of Israel, if Jewish settlements are haulted on occupied Arab lands. Could this be the end of 4U contacts and the beginning of a new country?..... YI - Fighting once again is brewing between the Iraqi Army and the Kurds. A future peace settlement here could recreate the country Kurdisan?..... S2 - Bangladesh. It is highly unlikely to see any operations from this third world nataion in the near future, as people flee their homes as massive flooding continues and the weather threatens with more cyclones...

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

1374. Noise Bridge vs. GDO?

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-29 12:46:29 UTC
From: morris@ucunix.san.uc.edu
Message-ID: <1991Jul29.124629.1540@ucunix.san.uc.edu>
Source record: 294948

I haven't managed to put two pennies together for a noise bridge (nor made the time to build one), but I have managed to pick up a fairly clean-looking Heathkit Grid Dip Oscillator (real tubes & everything!). What I haven't found is a real good discussion like I remember dimly from teen-age days, of "how to use a GDO"! I have a 70's-era Antenna Book as well as ARRL's current monster tome, and a few various handbooks from the 60's, 70's, 80's and 90's.

I think I've got the basic idea on how I could determine the resonent frequency of an antenna (like a dipole or vertical) I've constructed and want to cut to final dimensions--bring the transmission line up to the GDO, put a little Air-Dux-type coil between shield and ground/ladderline wires, and put the GDO coil "near" the Air-Dux. What I don't have a feeling for is, "how near?" "how big/long a coupling coil?" "what will changing the coupling coil parameters do to the GDO reading?" I guess I need an OF Elmer, but since I'm rapidly approaching OF-ism myself, I can't quite ask anyone I know around here--the faceless Internet crowd seems more friendly and less threatening!

If someone could point me to an introductory discussion of GDO use, that'd get me off on the right foot--maybe even from a Heathkit GDO manual!--and I could go from there. Thanks 10^6!

1375. Info. on power RF devices wanted

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-29 13:12:30 UTC
From: esrlb@warwick.ac.uk
Message-ID: <DBG}S1?@warwick.ac.uk>
Source record: 294951

I wonder if anybody has any info. on the following devices which I picked
up at rally (ham-fest) last year, but have had no success in finding data for:

Polycore F1005B (FET)

"AR711552AAN" (Bipolar - manufacturer unspecified, but made in Malaysia)

both types are 0.5" flange type packages. I would guess that they are V/UHF
devices in the 50-100W range, but would like to find out more.

Any help would be greatly appreciated,

Simon G0GWA.

1376. Questions about bringing a ham radio to Australia

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-29 13:29:48 UTC
From: howitt@arcac.whoi.edu
Message-ID: <1991Jul29.132948.15164@netnews.whoi.edu>
Source record: 294950
Cross-posted to: rec.radio.amateur.misc,soc.culture.australian,rec.travel

Hello:
My fiance and I will be travelling to Australia for our honeymoon
this September/October and he would like to bring his 2-meter Ham radio rig
to use as an information source while we travel by car from Cairns to Sydney.

We have the reciprocal license application and have received our visas
however the application says to allow three months for processing the
application and we have just about eight weeks before we leave. I plan to send
the application via overnight mail.

My questions are these:
1) How much does it cost (in AUS$) to send an overnight
letter from Australia to the US? (so I can include
this cost with the aplication)
2) If we ask nicely will the issuing agency expedite the
application? (Will they send the license using
overnight mail if I include the postage?)
3) If we don't receive the license on time will the authorities
let us bring the radio into the country? (If we bring
a copy of the application maybe?)
4) If they won't let us bring it into the country how can we
send it home?

Please respond by E-mail as soon as possible. I'd like to get the
application in the mail ASAP to give us the best chance of getting the license
in time.
Thanks in advance

1377. Re: Disable TS-440 BCB attenuator (How?)

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-29 14:02:59 UTC
From: uname%arrlhq.UUCP@uhasun.hartford.edu
Message-ID: <199@arrlhq.UUCP>
Source record: 294962
Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

Yes, the medium-frequency attenuation built into many modern radios seriously limits their sensitivity for people who want to enjoy DX reception at these frequencies. There *is* a method to the apparent madness behind their inclusion, however. These attenuators serve to reduce the potential effects of *second-order* intermodulation in these radios' front ends -- a very real problem because "the broadcast band" spans more than an octave. Second-order products -- simple addition and subtraction of two frequencies -- can make a bandful of junk fast. Example: Your radio's front end passes 0.5 to 1.5 MHz and you have two very strong local stations, one at 560 and another at 720 kHz. Hook a long wire to that front end and you'll also have a very strong local at 1280 kHz -- 560 + 720.

Built-in attenuation is the cheaper and dirtier of two solutions, the better
being narrower, preferably tracking, front-end selectivity. And tracking front-end selectivity is just what users add who use tunable loops for mediumwave reception, so such folk probably won't
suffer the effects of 2nd-order intermod.

1378. Alinco DJ-F1T air-band mod sought

>THERE.....
>NC1P I just couldn't resist this one but *really* it worries me.

It's worth noting that RS places a prominent sticker on their 10-meter rig (at least the ones I've seen) that warns that an amateur license is required for operation. Also, RS is now carrying the ARRL "Now Your Talking" book for beginning hams. Seems to me they are acting pretty responsibly. More so than most 800-number ham stores, in fact. I'm not worried, I'm encouraged.

Take a bunch of flyers from your local club (you know, the ones that have info about ham radio licensing classes) to your local RS and hand them to the manager. Explain to him/her how people that express an interest in ham radio will, if they manage to get licensed, buy radios, coax, connectors, tools and etc. at thge local RS. Your flyers will probably wind up being prominently displayed.

GDO's for antenna work:

I was interested in this same thing so I asked someone here at Tek who is reputed to be an antenna expert and has written a number of articles for QST.

He claims that a GDO is basically worthless for antenna work because resonance is not generally what you are looking for. I had, in the past, hooked my GDO to a properly tuned dipole and didn't make much sense of the readings so I'm inclined to agree. If anyone KNOWS different I would like to learn about any useful techniques because I am ready to do a new antenna.

1381. Re: Heathkit - Gone?

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-29 16:09:09 UTC
From: banko@lisboa.ks.uiuc.edu
Message-ID: <1991Jul29.160909.1489@ux1.cso.uiuc.edu>
Source record: 294955

i don't understand why heathkit got out of ham radio... it seems to me that much of their business has been for the ham world (at least as recently as 5 years ago, or so...)... their small practice kits, their computer systems, and their electronics courses and radio kits... perhaps hams have been losing the patience to build their radios and have balked when it might have cost a comparable amount to build a radio rather than to buy one from a manufacturer. with a US ham community of ~ 500,000 or so, maybe they see the home automation business as more profitable (simpler electronic boxes) and appealling to a wider audience...

even with the new no-code tech license... i never would have found my way to a Standard 2m HT if it hadn't been for Heathkit (and i didn't buy it at their closeout price either!), but i'm glad that i did.

i also wonder why heathkit never got into the magaazine kit supply business... the way some of these companies (A&A?) who have a kit "ready-to-sell" to go along with some of the projects discussed in QST articles, etc.

Source record: 294953

Joe,
Used towers are extremely dangerous to work with unless you know exactly what you are doing. Rohn and other tower manufacturers strongly recommend the use of professional tower personnel in dealing with them as well as erecting new towers. The reason used towers are available "standing" at a good price is that the cost of disassembling a tower properly and safely is often a substantial portion of the cost of a new tower. The cost of a new tower is only 40-50% of the total cost if it is erected properly! I have a friend that had a 5KW wind driven generator atop a 80 foot Rohn tower - it was struck by lightning fuseing the generator. He wanted to get rid of it and thought the tower might be worth something. The generator weighs over a ton thus requiring a crane to take it down (cost minimum $250 to get the crane to the site, another $250 maybe to get the generator and tower on the ground). Then, after spending this much money, the tower sections could be welded together by the lightning strike requring a cutting torch to seperate them. What is left is essentially junk. Even if not junk, the remaining tower, up for 6 or 7 years, is hardly worth more than a couple of hundred dollars (compare the cost of 80 feet of Rohn 45G guyed tower new at $1400-$1500; 25G at under $1000).

Some of the pitfalls in removing an existing tower:
ofthe tower may be rusted from the inside out degrading its strength
ofwhen the sections are bolted together, it is recommended that the bolts be tightened sufficiently to "crimp" the metal. Separating the sections usually requires specialized jacking equipment - dangerous to use when you are hanging onto a tower 50 or 60 feet off the ground

The only real safe method of taking the tower down is to do so all at once using a crane! Then the individual pieces can be separated safely on the ground and the tower can be inspected properly.

If you must try without benefit of the crane,
ofwhomever climbs the tower must be equipped with safety belt, hard hat, safety shoes, tool belt, and a lot of pre-planning.
ofyou should have at least two capable helpers on the ground, both with hard hats and safety shoes
ofthe tower must be guyed with 3 guys 120 degrees apart preferably at 10 foot increments but no more than 20 foot increments.
Temporary rope guys are o.k. provided they are sufficiently strong and adequately anchored. The length of a guy should be at least 80% the height of the point where attached to the tower.
of If, after guying and close inspection of the metal to insure its integrity, the tower feels secure, it is desireable to have two people up on the tower disassembling the tower. You will need another helper and safety belt in this case.
of You MUST have a gin pole to help in section separation and to

lower the disassembled section to the ground.
ofAn arrangement such as a scissors jack and two metal plates cut to fit precisely inside the tower section so that pressure is transmitted equally to the leg joints is required to "pry" the sections apart after the bolts are removed.

Even if you do not know the tower manufacturer, obtain an amateur radio tower catalog from Rohn. It contains all the requisite engineering specifications for tower erection - concrete base, guy anchors, size guy cables, etc. for various areas of the country.

Most towers, except so called crank-ups and light weight aluminum towers, are made to climb. The weight they can support depends upon the particular towers design and current condition. Determine the manufacturer and obtain specifications or stay off!

Unless you are a competent mechanical engineer, and your note suggessts that you are not, you may run into a host of problems designing your own tilt-over mechanism. A tower is designed to handle a load comprised of mostly vertical components. The lateral loads imposed on a tower when tilting it over can exceed design limits and cause structural failure.

People do climb towers to adjust antennas. Sometimes this is accomplished by loosening the boom and sliding / rotating the antenna until a given element can be reached. Sometimes it is necessary to take the antenna down and put it up several times until the adjustments are perfected. There are a variety of platforms, ladders and other appurtenances available to assist work efforts at the top of a tower. If you intend changing antennas frequently or doing a lot of antenna development work requiring frequent adjustments, maybe a crank-up and/or tilt-over tower designed for that purpose is more appropriate for you.

How others work with their towers? I have one ham friend that thinks nothing of running to the top of his 80 foot Rohn 25 tower in the middle of a stormy night in the dead of winter to adjust an antenna. Other ham friends wouldn't climb even if it meant they would not operate ham radio; they depend upon their fellow hams to help if they need it.

Personally, my wife extracted a promise that I would not climb the tower. (Not hard to comply with as I DO NOT enjoy climbing). I installed a Rohn 45G tilt-over guyed at the hinge point and at the apex. When I want to adjust an antenna or install a new one, I simply disconnect two guy wires and tilt it over so I can work comfortably on or very close to the ground. The benefits more than compensate for the ten minutes or so of manual labor required to crank it back up again. My tower and antennas were installed to withstand 125 MPH winds (in excess of what is required for my area) using Rohn's specifications. I did my own installation engineering (I have 15 years of experience with commercial terrestial communications system design and installation in my background) but hired a contractor to do the actual work with me helping (on the ground!). I have clocked windspeeds of 80+mph and endured 2+ inches of ice from freezing rain without significant damage to either tower or antennas. (Fortunately, not both at the same time! A two to three inch ice coating on my 64 foot tower plus beam antennas equated to about

18 tons of ice.) My pleasure derives from having the use of the tower, not in having to spend great quantities of time maintaining it or worrying if it will come crashing down with the next storm.

Good luck. Wayne KB6CSP

Before you do anything make sure that you have ALL info on the tower:
MODEL
TYPE
MFG.
It is of utmost importance to get original specs. from the mfg.
as to the instalation procedures, and follow them to the letter.
In addition you may need building permit from the local authorites,
with inspection.
DO NOT use your house as att. point since tower will sway in the wind
and you are going to stress the structure and poss. damage it.

Tower of any hight and sure of 70 ft are not toys and since you are not
a kid act accordingly.

Lot of good hams lost there life "toying with the towers"

from the log of AA6AD

1384. ICOM R1 now available in the USA... !!

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-29 17:12:24 UTC
From: gary@ellis.uchicago.edu
Message-ID: <1991Jul29.171224.11220@midway.uchicago.edu>
Source record: 294956

Well, its confirmed. The R1 is now available in the USA. It appears in
the Grove catalog and EEB ads. The price from EEB is a whopping $539.
Grove has no price yet. AES and HRO are in the dark.

From other info I had (not confirmed) the R1 cost in Japan in american $$$
is $329. So, I wonder if AES, Grove or HRO will beat this price from EEB.

You'll find ads in Popular Communications for the R1 being sold by
private individuals, new, in a box for under $500. But no warranty
since they are being sent directly from Japan.

In any case, the R1 is now 2 yrs old. Although its "new" to the USA
I wonder if the R1 is already obsolete.... ?

The $100k figure is conservative. Don't forget, "overhead" includes
engineering support (PC layout designers, machine shop, computer support,
etc.) as well as salaries and benefits.

(Actually, HP is now offering us a year's salary to QUIT!)

HELP!

I am looking for a source to purchase some 700 maH NI-CAD AA batteries.

DIGIKEY has them for $3.73 each, which seems a bit steep.

I seem to remember seeing SANYO 700 maH batteries at the Dayton Hamfest for
~ $2.50 each (new).

Anyone have a good source for NI-CAD's?

Thanks in advance for your assistance.

Would someone from NYC please let us know how the 2-meter situation is
down there? Every 'electronics junk store' on 5th (and Lex) has a
wide line of 2-meter handies for sale. I really doubt that any of them
check for licenses.

Also, why don't we come up with a form letter that we can send to the
managers of the RS's in our areas that explains our concerns. While
we are at it, it should also include a list of ham clubs in the area
so really interested people would know where to turn. This will probably
be much easer (and better in the long run) than flaming Tandy.

>He claims that a GDO is basically worthless for antenna work because resonance
>is not generally what you are looking for.

I think useless is too strong, but a GDO certainly does NOT substitute
for a good noise bridge! There are times you DO want to know a resonance,
like adjusting traps in a trap antenna. Otherwise a GDO is mostly useful
as a signal source for very low power tests.

Coupling to the center of a dipole through a FEW (<20ft) feet of coax can
be useful in determining the resonance of a dipole, but a noise bridge
does the job better and more accurately (especially if it is within 1-2
ft of the antenna thus eliminating SWR/"tuned line" resonances.

I can't buy this tired old argument. Radio Shack has been selling
a 10m rig for quite some time. The 10m band, particularly the
novice portion, is one of the best behaved bands. It certainly
has fewer rude hams than the 20m phone band, which requires at
least a General. Lower license requirements and/or better availability
of rigs does NOT mean more chaos on the bands.

Good point! A recent survey indictates that 80% of VCR owners have
never recorded a TV program while away from home. The vast majority
of people don't know how to use gadgets. My girlfriend, who is
bright and highly educated, bought an answering machine that went
unused for 6 months until I showed her how to record an outgoing message.
It sounds like the RS rig will have enough bells and whistles to
confound the average joe.

>seems more friendly and less threatening!
>

Funny you should ask that, I just bought a very nice AN/PRM-10 Military
GDO at the Flagstaff swap meet last weekend. It's a real piece of work
which is built like a fine instrument. Here's what I discovered:

Any small coil of wire will do - you don't need an air-dux coil to
couple to an antenna. For the lower frequencies, 80M and 40M, three
or four turns of wire seemed about right, wound right around the
GDO coil. For the higher bands like 10M, only a turn or two would
do. Too many turns and the object under test will suck-out the GDO
at resonance, making it hard to get an accurate reading. It appears
that you should use enough turns to get a 50 percent meter dip at
resonance.

I found that the GDO was pretty accurate in showing me the resonant
frequency of my 40 Meter dipole which I had previously tuned for
lowest SWR at 7200. The Butternut vertical, the HF6V was much more
interesting since it had some strange dips just about everywhere.

My Butternut works quite well in practice so I'm not the least buit
worried about it. Some things were very interesting, however. For
example, on 20 Meters there was a very strong dip at around 13.5 Mhz
and a weaker dip at 14.05. Nevertheless, my antenna has a perfectly
acceptable SWR of about 1.2:1 across the 20M band.

I don't think that a GDO is of much use on a 6 band antenna since
the overall reactances are so complex. For mono-banders, however,
I believe that it tells the truth, at least 90 percent of the time.

I'm looking forward to more fun with this new toy, as for example I
found that one of my random 12 inch test leads resonated at about
112 Mhz :-).

By the way, this particular unit also serves as an absorption wavemeter, and a diode detecter unit. There is also a selectable 1000 Hz modulation tone as well as provision for external modulation of the signal. Hey, maybe I can even work QRP with this thing! :-)

Any other GDO tales out there?

Here's a trick question for some readers:

Can you determine the resonant frequency of an antenna system using an SWR Bridge? In other words, when your SWR is 1:1, is your antenna resonant?

(hit return for answer)

Answers: No and Not Necessarily.

Resonance is defined as Xc == Xl

By definition, Xr can therefore be any value, say for example, 300 ohms. Would this give you a 1:1 match to 50 ohm coax? No.

Question #2:

Do antennas work best when they are resonant?

Answer: Yes

Question #3:

Are GDO's useful in antenna work:

Answer: Yes

Question #4:

Are there better tools than GDO's for antenna work:

Answer: Yes, but the GDO is what I got for such a good deal at the swap meet. :-) :-)

73's and flames/corrections/better explanations welcome,

Summary: Pro-2004 Problems
Expires:
References: <60950003@hpcuhb.cup.hp.com>
Sender:
Followup-To:
Distribution:
Organization: University of California, Santa Cruz; Open Access Computing
Keywords:

I'm having some troubles with my Pro-2004 scanner and I'm hoping someone
can help. Symptoms: After listening for a while, the scanner would freeze
up for no apparent reason. Stuck on a channel with the display as if there
were a carrier, however no audio, and no squelch rush when the squelch is
turned all the way down. Keyboard beeps, but does nothing. Turning it off
and then back on reveals a very slow power off time (ie: display light fades
instead of blacking out) and turning it back on reveals a completely blank
display, backlight working fine, dimmer fine, keyboard beeps w/o function,
sound squelch button does not light, no audio (regardless of vol/squelch).

This problem was usually resolved by unplugging the unit and leaving it unpluggedd for
10-15 minutes, plugging it back in, and everything worked fine. Amazing.When I originally
had this problem, I posted to the net, and someone was
curious if when it was 'dead', programming a channel did anything. I tried it
the next time it died, and low-and-behold, upon getting the scanner online,
I found that whatever I had programmed while the display was blank was indeed
there.

The problem seemed to go away, but unfortunately it reappeared, months later.
Now the thing is really dead. It will not come back to life, and it sits
in the same 'no-audio, no-display, display fade when turned off' mode. I
tore it apart and looked for the obvious: Loose connectors or hot/burnt
circuitry, but found none. It does have the mods done for increased scan
speed, 400 channels, and 800MHz restoral.

Someone long ago posted a possible fix for this, but I (stupidly) ignored
it as I figured mine was fixed. I'm not an electronics guru, and have little
tools other than a DMM and a soldering iron. I figured I'd try to get a
schematic from RS and isolate the bad area (since many functions still work),
but I'm unsure if they can still get the 2004 diagram/service manual.

Any help with this would be most appreciated. Either via email or the
net. Thanks in advance.

Bert,

I would suggest you look into QST, CQ etc. and find a stateside
QSL manager for an active DX station in your call area. Write
him a letter and explain him what you want. I believe he will
be more than happy to sell you some IRCs.

In know that W3HNK is selling IRCs for a very low rate (65 cents
is what I heard - but might have changed with US postal rate
changes).

I'd say: YES. When you measrure a VSWR of 1 that means you have
no reactive components, ergo R=50 Ohms, X=0. Reactive components
will always increase VSWR, so I'd think that resonance ocurrs at
the frequency of lowest VSWR. Hw?

1406. Source for telegraph key

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-30 12:07:09 UTC
From: kevin@noc.hfh.EDU
Message-ID: <9107301207.AA07836@snmpmgr.noc.hfh.edu>
Source record: 294881

About two weeks ago, I saw in a renovated telegraph station (the old Davison, MI station) a morse key which was the successor to the traditional up-and-down (for lack of a better description) key. The key used a side-to-side motion and MECHANICALLY auto-repeated the dots. I was told who invented this but I can't remember the name. Anyway, does anybody know of a source for such a key. I'm not looking for a paddle, iambic or otherwise.

regards,

kevin@noc.hfh.edu

Okay, what's the resonant frequency of your 50-ohm dummy load?
You DO know its VSWR value :-)

I.E. It's easy to get 1:1 VSWR reading on a length of 50-ohm coax!

OK, here's my whack at it. This is written from the point of view of an officer or representative of a radio club. Comments welcome, and may be used or modified without permission, although I wouldn't mind knowing if somebody uses it as the major part of a letter.
-edg

Dear %rs_mgr%,

My name is %say_your_name% and I represent the %radio_club% radio club. First, we would like to offer our encouragement and congratulations as your store begins to sell the new %model_no% two-meter handheld amateur radio. We hope that this will result in many new hams in our community here in %geographic_area%.

We are writing today to express two concerns that arise with the availability of ham radio-capable transmitters at genera-interest stores such as Radio Shack.

First, it is a common concern in the ham community, both nationwide and here in %geographic_area% that these radios will fall into the hands of individuals who have no interest in becoming amateur radio licensees, but rather will use them for casual communication on the amateur band in violation of federal law. We hope that your salespeople will be trained to ask to see a ham radio license at the time of sale, and to question sales where the purchaser cannot produce a license.

We would like to remind you of Radio Shack's company policy regarding such sales: [We should obtain some formal document from RS in Ft Worth] %policy%

We recognize that prospective hams will wish to purchase these radios in preparation for receiving their licenses, and encourage such enthusiasm. If a person has no license, but says something like, "I'm halfway through the book and want to listen," or, "I'm waiting for my license," or even "I'm taking my test soon," then it shouldn't be much problem. After all, the prospective ham will be proud of his studying and will wish to talk.

One danger sign, on the other hand, would be a purchaser buying two radios, and asking about point-to-point range. Another would be somebody who is not sure what the radio does, but is not willing to purchase the "Now You're Talking" study guide and is not interested in ham clubs or other resources.

I realize that this is not a common concept to a sales oriented person. Typically we try to sell our wares to all comers. This restraint, however, is essential if the %model_no% is not to become just a better walkie-talkie to the detriment of both hams and the business community.

The second concern that we wish to express today relates to the need for the new ham or prospective ham to find resources in the community. Nobody can join this hobby successfully by remaining in a vacuum. Traditionally, the new ham was guided in his or her preparation by an experienced operator. We call this guiding, teaching ham an "Elmer."

With the advent of the code-free license, it is possible for an individual to buy a copy of "Now You're Talking," or other study material, and prepare alone for the tests. In fact, it's possible that the first ham the new student meets will be the volunteer examiner giving the test! With this in mind, we would like to provide your store with a guide to local resources for the new ham. Flyers with this information are enclosed, and you are welcome to call me at %my_phone_number% when you need more.

Please give one of these flyers to any customers or visitors who inquire about or purchase ANY ham related material, such as study guides, HTX-100's, %model_no%'s, or even scanners, when the customer asks if the scanner will receive ham radio. This material will direct the customer to clubs, classes and test sessions that will speed him or her toward a ham radio license. Even licensed hams may find the guide useful.

Traditionally, Radio Shack and the ham community enjoyed a close relationship. As Radio Shack's focus changed, that relationship has become somewhat distant. We in the %geographic_area% are pleased to welcome your Radio Shack store as a strategic partner in the growth of ham radio once again, and trust that this will be the beginning of a mutually beneficial relationship.

Yours sincerely,
%RADIO_CLUB_NAME%

OK, I'll bite...

>Here's a trick question for some readers:
>
>Can you determine the resonant frequency of an antenna system using
>an SWR Bridge? In other words, when your SWR is 1:1, is your antenna
>resonant?
>
>
>Answers: No and Not Necessarily.
>
>Resonance is defined as Xc == Xl
>
>By definition, Xr can therefore be any value, say for example,
>300 ohms. Would this give you a 1:1 match to 50 ohm coax? No.

While antennas may have all sorts of resonant impedances, an SWR
of 1:1 indicates that the line is terminated in it's nonreactive
characteristic impedance. Since this only happens with a) resistors or
b) resonant antennas, then you've got one or the other at the other end.
For almost any antenna one of us is likely to encounter, 1:1 works fine.
Walt Maxwell (W2DU) discusses this in his book "Reflections" and
does a good job of it.

>Question #2:
>
>Do antennas work best when they are resonant?
>
>Answer: Yes

Not necessarily! A 5/8 wave antenna is not resonant yet works well. In fact,
numerous analyses have shown that short antennas work just as well as
full-sized antennas as long as resistive losses are kept under control. The
"radiation resistance" becomes quite small as antennas are made shorter and
shorter, but the only problems arise in the large RF currents required
by them and so the resistive losses in the coupling networks and the
antenna materials themselves. There's nothing magical about resonant
antennas.

>Question #3:
>
>Are GDO's useful in antenna work:
>
>Answer: Yes

You bet! To properly measure antenna resonance, I understand that
you must couple directly to the antenna itself; otherwise you'll find a
resonant condition of the antenna *and* its associated transmission line
(which is an impedance transformer). Curiously, the same applies to
noise bridges. However, if the transmission line length is known, then
with noise bridges the transformation caused by the length of transmission
line can be removed (Smith charts, don'cha know). If the transmission
line is short (a small fraction of a wavelength) then either instrument will
get you in the ballpark.

>Question #4:
>
>Are there better tools than GDO's for antenna work:
>
>Answer: Yes, but the GDO is what I got for such a good deal
> at the swap meet. :-) :-)

You got a heckuva deal! Why can't *I* ever find deals like that?:*)
The only GDO's I've found at swaps were, um, rather tattered and worn...

Welcome to the hobby and hope you will enjoy it as I have for last
54 years.
You are absolutely right ..... Y O U D O N ' T N E E D $$$$$$$
however if you have been raised in the society of instant pleasure
you may have to pay the price.
I could take you to the time when ham station had one tube receiver
one tube xmter and " Windom" ant. To day - well - you have numerous
ways:
1) You can build your own station
2) You can buy used one.
3) You can order a new one with instalation

To build one, look into the ARRL handbook
To buy used one, get in touch with the local ham clubs and inquier
about swap shops, radio flee-markets, and/or hams who may not be
on the market but are willing to help new comer like you.
Just the other day I heard that one of the most prestigious set ups
of 60th Drake R4B rcver and T4X xmter, was for sale for $280.
As for the ant. dipole or vertical will do the job.
Good luck and tell us about your progress - we care!!!

Hi Gang,

I realize that this question is not directly ham related, but only hams would have an interest in the answer.

How does one go about decoding the numbers which follow a TV program listing? I presume that encoded info is CHAN, TIME, DATE, but in reverse order.

Would appreciate obtaining and data that can be mustered. BTW: This info is purely for curiosity and amazement.

one thing about the codeless license that has just recently occurred to me
is that more and more people might get a codeless license just so that they
can "market" products to hams and use their callsign in the advertising...
this could be good or bad, depending on the way you look at it... it might
mean that more people will start offering ham-related products, but it also
might mean that it will be even harder to discriminate between dealers of
good products and bad (although that has nothing to do with having a license
really, except that one might expect that a ham is more likely to treat
other hams fairly than a non-ham might, since they both have a stake in
amateur radio, and one's callsign, like one's name, is hard to clear if
tainted by a record of unfair dealings).

1416. IRCs

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-30 17:18:02 UTC
From: oo7@ut-emx.uucp
Message-ID: <53218@ut-emx.uucp>
Source record: 294894

Adding to several other suggestions made here recently - another way of getting hold of some IRCs is to be aware of recent DXpeditions, especially if their QSL managers are in this country. After the Rotuma expedition, the NCDXF had a lot of IRCs that they sold off. If the Albanian station comes on the air soon, the QSL managers will have a few tons of the things to get rid of. So get hold of a DX newsletter, look under the "QSL via.." heading, and write to a few managers.

Depending on how many IRCs you need, you could always become a manager for a semi-popular station. Many people will send you 2 IRCs for a card, you use a 50c stamp to send one back, and you've just bought IRCs for 25c each. Even if they send only one, you get one IRC for 50c. Of course, when you add the cost of the cards, envelopes and your time hunting through the logs for people who get the time or day way off, you'll find that it's far simpler to buy IRCs for 95c each at the post office :-)

And to answer another query, when you send an SASE to a U.S. manager for a DX station, you need send only the SASE. The manager is out the cost of a card + envelope, and they do appreciate it when someone sends a $ or a spare stamp as well, but it certainly is not expected.

I've done a small amount of QSL managing for a friend - he even bought the cards, sent me the computer logs, and made my life very easy. I got some IRCs out of it (although most overseas hams send $ bills), I didn't make any monetary profit but I enjoy doing it at a low level. I even sort of enjoy getting and answering the bureau cards that come in for a couple of years after the expedition...

And no, sorry, I don't have any IRCs for sale :-)

>Answer: Yes

As with so many things with antennas "it depends". There ARE "non-resonant" antennas, designed to operate across broad frequency ranges. THe "discone" comes to mind.

One of my favorites is the open wire fed "tuned dip. It is typically NEVER operated at a resonant frequency, the "tuning" comprising matching of the open wire line to the xmtr by an antenna tuner. Properly installed this type of antenna is VERY efficient.

>Are there better tools than GDO's for antenna work:
>

Glad you got what you wanted there - it was a good gathering IMHO, until it rained at 4:30 at least :-)

Personally I find the Palomar Engineers noise bridge very hard to beat for antenna work below 440Mhz. You use your recvr as detector and a built in noise generator as the source to be nulled. Fast easy and CHEAP!

>Ben, DL6RAI

Your argument is valid only in the case where the feedline impedance
is exactly the same as the antenna feedpoint impedance. For an
antenna Z of 50 ohms and a feedline Z of 50 ohms, you are perfectly
right - adding reactance (lengthening the antenna, for example) will
raise SWR.

When the antenna Z is different than the feedline Z, all bets are off.
You have to remember that impedance along the transmission line varies
sinusoidally due to the SWR on the line. Hence, you can add a
reactance to cancel the reactance you see a particular point along
the feedline (for example, at the transmitter end). So, you are adding
reactance to cancel an existing reactance to lower SWR.

For more info, I'll recommend the book that was originally recommended
to me - it's really a good book. Reflections, by Walt Maxwell, W2DU,
published by the ARRL.

> application? (Will they send the license using
> overnight mail if I include the postage?)

I don't know, check with the Australian Embassy/Consulate in Washington,
or NY or LA or.... wherever, or call the AT&T Overseas Operator and
obtain the Australian phone number for the correct agencies and call them
and ask. I suspect the overwhelming delay is in crunching through the
piles of mail, doing the data entry, processing and license printing, NOT
the delivery time.

The American Radio Relay League in Newington, CT is a self-proclaimed
"expert" on the nuances of overseas licensing and might be able to offer
advice. Then again, maybe not.

Yes, calling is expensive, but this IS a once-in-a-lifetime trip and you
did think it important enough to post to the net, right?

> 3) If we don't receive the license on time will the authorities
> let us bring the radio into the country? (If we bring
> a copy of the application maybe?)

Ask Customs, ask your travel agent, ask the Australian Embassy/Consulate, ask the .... (get the idea?)

> 4) If they won't let us bring it into the country how can we
> send it home?

They will probably confiscate it and hold it until your return trip, ship it to you, or never return it. Customs agents are funny that way.

>

Call the "experts" who are supposed to know these things, like U.S. Customs, your travel agent, Federal Express, the U.S. Post Office, the Australian Embassy or Consulate, the appropriate Australian agencies down under, etc...

Good luck with your trip, but remember, the natives get annoyed if the tourists ask them too many questions.... :-)

1422. Trip to Hong Kong and Macau

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-30 18:10:32 UTC
From: waters@nddsun1.sps.mot.com
Message-ID: <1394@nddsun1.sps.mot.com>
Source record: 294898
Cross-posted to: rec.radio.amateur.misc,rec.travel

I am in the planning stages for a vacation trip to Hong Kong and Macau this fall. This is a frequent flier bonus, so I don't have a lot of excess cash nor much flexibility in schedule. It will also be my first visit to Asia.

I have contacted ARRL about reciprocal operating and HKTA about general advice. My questions:

1) Is there a club or contact in either country who could help me do som HF DXing.Both countries are moderately rare and I would like to try DX from "the other end"

So far my plans are to take only my 2M/440Mhz radio, my HF gear is too large to take.

2) Any advice on what to see/avoid?

The concensus so far is not to bother trying to find "bargains" because U.S. discounters have as good price but with US warranties.

>I.E. It's easy to get 1:1 VSWR reading on a length of 50-ohm coax!

In case anyone out there hasn't heard of the trick, a good way to check the quality (i.e. LOSS) of coax is to short circuit or open circuit the far and and measure the VSWR. A 1:1 VSWR means SCRAP the cable!

THe HIGHER the VSWR of course the more power is getting reflected. Just remember that this measure TWICE the total loss.

Another reason to check the antenna at its terminals not at your shack!

Does anyone know how the Poulsen Arc CW transmitter worked? This was popular back in the twilight days of spark, and generated a near-perfect CW output. It used alcohol for something, anyone know what? Is there anyone on the net old enough that knows what one sounded like?

Foothill College in Los Altos, CA has one sitting out in their court-yard by the electronics museum. It looks like an overgrown fireplug.

*Also, why don't we come up with a form letter that we can send to the
*managers of the RS's in our areas that explains our concerns. While
*we are at it, it should also include a list of ham clubs in the area
*so really interested people would know where to turn. This will probably
*be much easer (and better in the long run) than flaming Tandy.

I certainly didn't want to promote that Radio Shack be flamed, thats why
I used the word "encourage". But this is an excellent idea.

There is a repeater in Mill Valley (just north of San Fransisco) at 145.29 MHz.
This repeater gets alot of bootleg/pirate use. No call signs, profanity, etc.
I'm new to ham radio (less than a month), so I asked around, and everyone
seems to know about it. I hear things like "its a magnet for those people,
so it keeps them off of the other repeaters". It seems to have been tolorated
for at least a couple of years. I have no idea who the repeater owner is.

>We've received a request from a professor in the USSR who is interested
>in using satellites as educational tools in secondary schools. His
>interest encompasses using satellites to establish international
>school-based networks and also Earth observation from space as an
>educational resource.

I just came back from the 6th AMSAT-UK satelite colloquium which was held
in Surrey, England last week. There was quite some interesting news, as
usual.

Leonid Lebutin UA3CR announced a rather interesting possibility: for the
next 10 years, there will be 2 or 3 possibilities PER YEAR to have an
amateur satelite module built in in a Russian educational satelite
and launched FOR FREE! At every launch there is an amount of space (about
20x40x60 cm) reserved for the amateur satelite community. Power can be
obtained from the satelite itself (about 50 watts) so one can concentrate
on the payload itself.

To me, this seems an enormous possibility. It looks like the same amount
of space as a whole microsat will be available, just for the payload! Also,
the power available (50 watts) seems enormous: using circuitry like the
high-efficiency power amplifier of Matjaz YT3MV (if I remember correct;
the amplifier of DOVE) it looks like a downlink power of 30 watts at least
should be possible. Copying this on handhelds should be easy.
Of course other possibilities are available too.

I was only attending on Sathurday and Sunday and missed quite some interesting
talks on Friday, but other news I remember is:

- Dr Karl Meinzer DJ3ZC told about the plans for phase 3D. This device should
produce about 10dB better signals then the previous phase 3 devices. It
is also the largest amateur satelite: about 3 meter in diameter
(This means a lot of problems, so far unknown to the amsat community:
an amateur satelite usually can travel with hand luggage, while this
device won't fit trough a door in once piece and will probably be split
in parts to be assembled at the launch site..)
- DJ3ZC also told, that since Phase 3D will look like a ring, there is some
space left in the inside. He thought about building a small satellite to
fly in an orbit around Mars, or other wild ideas. AMSAT-DL does not have
the capacity to build this; other groups are invited to work on this.
Any volunteers?
- UA3CR told about the problems with RUDAK-2. It seems as if a preamplifier
in the receiver is oscillating. The whole amateur installation will be
switched off in August so things can cool down and hopefully the oscillation
has disappeared when they are switched on again.

The 12 dB attenuator which was switched on by accident in the past does
not cause oscialltion in the engeneering model.
- F6BVP told about the ARSENE project. Hopefully, it will be launced july
next year.
- ZS6AKV told about satelite plans in South Africa (SUNSAT, built on
Stellenbosch University). The lecture about it was in Friday so I
missed it, but I took a copy of the information sheet and it looks like
a device with store-and-forward possibilities, position localtion and
imaging using CCD cameras.
- KA1ST told about KITSAT, a satelite to be built by Koreans at the University
of Surrey (England, 'the UOSAT factory') in order for Korean engeneers
to gain some experience in satelite building and usage. It will use
a similar scheme as OSCAR 22: 2 downlink frequencies, one for amateur
usage and one for Korean Research usage (the second frequency is not
in Amateur frequency bands).
KITSAT will look much like OSCAR 22.
- The UOSAT team told about the status of OSCAR 22. All seems well on board.
They were able to show the first images from this bird; Brian Kantor
already placed samples on ucsd.edu for anon FTP so get a look yourself.
- UA3CR had some unique pictures of older Russian amatuer satelites like
RS1 and 2. During the launch of RS 1 and 2 there was a 4th object which
which was never identified. Now, Leonid explained that was meant to be
RS3 (not the RS3 we know about now) but the solar panels could not be
opened and it died after 11 hours because the battary exhausted.

I am afraid thet I forget to mention at least half of the information
I received during the colloquium, and apologise for groups I didn't mention
or other errors. Sorry guys, the weekend is quite intensive and I'm not over
it yet!

Many thanks to Ron G3AAJ and the rest of the AMSAT-UK crew for organizing
this unique colloquium for the 6th time already! It was a great success,
and certainly worth repeating next year. Thanks Ron!

If you want to attend next year, I suggest you make contact with Ron
so you can get an attendance form yourself when it comes available
next year. The colloqiuim usually takes 4 days. Sleeping facilities
are available for fair prices on campus.

An unique event!

In reply to the poster who asked, I live in Austin and I think I would have heard from local hams if there was anything special to warn you about in dealing with these folks. I've only ever bought log books from them, so am hardly a major customer, nor do I have a vested interest in their operations! The only reason I might not deal with them is the 8% local sales tax, but that's not a serious concern when I am in the market for a log book :-)

>>I vote for ftp version of the tapes.

Oy ! Not on my net, please.

>Has anyone stopped to determine what it costs to ftp this much data?

By the time it gets copied by 500,000 hams, it could get !really!
expensive. The communications gridlock would be like SFO just after the
quake. Like someone has said, you really can't beat the bandwidth of a
UPS truck full of mag tape.

I think the wave of the future will be CDROM on packet servers. The
users could pay the SYSOP for the privelege. If you wanted to tie up
the spectrum downloading it, you could do that too. My rather foggy
memory tells me it costs about $2000 to master a CDROM and about $2/copy
after that. CDROMs are certainly cheaper to mail than a 2400' reel of
tape.

>1) What is the maximum current I can put into a BP-8 or BP-3 battery
>pack? Wattage?

You can usually charge NiCads at up to 4C. The BP3 is 270(?) ma-hr and I've charged it at 1.8 amps, which works out to about 8C. It got a little warm, but not too bad.

I should mention that you need to be able to turn off the current when the battery is charged, or you will destroy the cell.

>2) Can I be charging the attached battery and using the HT at the
>same time? (Using the charging battery as the power source.)

No problem. The easiest way to regulate the NiCad charge is to use a temperature-controlled switch to disconnect the solar cell from the NiCad when the NiCad gets warm from overcharge. The TCO on the BP8 should be adequate. This will eventually destroy the pack, but you get what you pay for. A more sophisticated peak charger may not work well with a solar cell - the voltage varies too much.

If you want to go the voltage regulator route, charge the pack at C/10 (or C/20 to be really safe) overnight and set the regulated voltage to that level.

>kevin@noc.hfh.edu

Try finding some used gear. Most major metro newspapers have a classified section for Ham/CB gear. Many clubs run a swapmeet/hamfest during the year - find out when they are. If you really want to save money, you may have to be patient and look around. Most CW ops have ongoing relationships with their keys/keyers/paddles, so expect to buy a new key.

The old Heathkit tranceivers cost about $150 and can even do SSB ! The cost of wire dipoles is exceedingly cheap, especially if you buy wire by the pound at the local electric motor repair shop. The aforementioned radio can easily load up a 40 meter dipole on 40/20/15/10. You can usually find used coax in fair condition at hamfests, so you might be on the air for under $200.

Yes, Jamboree On The Air is always the third weekend of October. That means 19-20 October this year.

For the benefit of those who are not familiar with this event, it is a wonderful way to interest young people in Amateur Radio. Most of us have had the experience of trying to demonstrate radio only to find there is a big contest, or the people you do hook up with don't have a lot to say that your visitors can relate to. In JOTA, the idea is to get a rag chew going between the scout or scouts at your station and those at another. Get them started by saying their name, troop number, rank, etc. Pretty soon they will start asking each other about where they go camping, who they want to win the World Series, and all sorts of things.

Both Boy Scouts and Girl Scouts are interested in learning a lot of things, and used to applying a bit of effort to master new skills. If you show them how much fun it is, be prepared for questions about how to get a license. The Boy Scouts even have several merit badges which can be earned: Electricity, Electronics, and Radio. One of the requirements for the Radio Merit badge is to tell how to get a license!

More details can be found in QST in September or October or by writting the ARRL.

Maybe, but it certainly does have a lot more pirates. I don't recall
EVER hearing a pirate on 20 meters (not that I listen to the phone portion
of the band very often!), but there are lots of them on 10.

Part of the problem is undoubtedly the proximity of 10M to 11M CB,
but it seems pretty obvious that at least part of the problem is the
ready availability of radios in mass-market (non-ham-oriented) outlets.

> Can someone give me this year's dates for Jamboree on the Air?

First the dates. JOTA is always held on the third _full_ weekend of October. Hence it will be held between 0001 hours 19 October till 2359 20 October 1991 local time (alright, strictly speaking I've chopped 2 minutes off it!)

For those amateurs who are not aware of JOTA a brief summary.
Established in 1956? by a group of scouters returning from a European Scout Jamboree JOTA is run annually to allow members of the scouting/guiding fraternity worldwide to contact and participate in the friendship of scouting. Amateur volunteers offer the use of their stations (in accordance with national 3rd party rulings) and a truly international experience is had by all.

In my role as JOTA Co-ordinator for the Scout Assoc. Eastern Region I would be interested in any amateurs and/or scouting groups who would like to establish scheds with scout/venturers in the Eastern Region of Victoria , Australia (this region comprising roughly the portion of Victoria to the east of Melbourne (the state capital) generally has at least 600 uniformed participants in JOTA each year, the region contains a diversity of rural industries and is the brown coal/electricity production centre of Victoria).

1442. Major Solar Flare Alert - 2 Events - 31 July

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-31 03:39:05 UTC
From: oler@vp.uleth.CA
Message-ID: <0094C63E.4EBDA320.1189@hg.uleth.ca>
Source record: 294906

-- MAJOR SOLAR FLARE ALERT --

JULY 31, 1991

Flare Event Summary
- Low Impact Possible -

MAJOR ENERGETIC EVENT SUMMARY

Two major energetic flares have occurred over the last 24 hours. The first, a class M7.2/1N flare with a short duration (1 minute) tenflare began at 07:05 UT, peaked at 07:10 UT and ended at 07:12 UT on 30 July. This event was extremely impulsive and was not associated with any sweep frequency events or particularly significant radio emissions. This flare was located at N14W58 from Region 6734, which is continuing to decay.

The second major energetic event was a class X2.3/2B tenflare which began at 00:45 UT, peaked at 00:52 UT and ended at 01:24 UT on 31 July. This event was also quite impulsive. This flare was located at S18E12 within Region 6749 which has shown significant growth over the past 24 hours. No sweeps were involved with this flare event.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

The first class M7.2/1N tenflare of 30 July will not have a terrestrial impact. The last class X2.3/2B tenflare of 31 July could have a low to possibly moderate terrestrial impact on 02 August, although we do not anticipate anything particularly significant. A more detailed prognostic forecast will be prepared later this UT day and will be available on the STD BBS by 01 August. Generally active geomagnetic conditions may be observed if an impact materializes. There is only a very slight risk for a minor geomagnetic storm. At present, we do not anticipate any geomagnetic storming, except possibly over the high latitude regions on 02 or 03 August assuming an impact materializes. There is a fairly high probability that no terrestrial impacts will be observed.

Occassional major flaring could continue to be observed over the next 24 to 72 hours. Most of the flare activity should be observed from Region 6734, which is now approaching the west limb. Region 6749 will cross the central solar meridian within the next 24 hours and is in a fairly good geoeffective position.

** End of Alert **

Yes, I have used ethernet coax to feed a 2 meter antenna for my packet radio system. Ethernet is similar to RG8U foam coax. Similar impedence 50 ohm. Similar attenuation. And Ethernet has a very nice shield.

You may want to inspect used ethernet coax for the presence of vampire tap bites. Especially if you're thinking of using it outside.

Needless to say this has been discusses in sci.crypt and, no, it's not
that simple. Basically it's done in a way that makes the more popular
prime-time shows have the shorter numbers.

A friend of mine (My boss actually) has an SBE OptiSCAN scanner. The problem is the programming. This scanner is programmed by a card that has 10 rows of 15 numbers each. You knock out the numbers on a row to program that channel. We need the programming ingo. I've tried playing with BCD, normal Binary, msb>lsb setups, and havn't gotten alot of headway on this.

SBE is out of business, so I'm told. SEARS carried something similar at one point in history, and I think both were manufactured by Uniden (No help either.)

If you have any information on these, please mail me, as I usually have too much traffic to read everything on the groups, thanks.

Also, I'm looking for a 516-FS for a Collins 32S-1.

SUBJECT: Ethernet for transmission cable?

Troy T. Pummill N6XMV (trop@hls.com) asks:-
>
>
>Has anyone ever tried to use ethernet cable for transmission line???
>

Well i have. The thick yellow stuff is almost-but-not-quite the same as
RG8. Its stiff and more inflexible than RG8, so OK for long fixed runs.
Beware if its been used with 'vampire' transceiver taps; the little holes
need plugging with something to keep the local climate out of the cable;
RTV rubber sealing compound stuffed into the hole, and a wrapping with
tape, seem OK.

Pete Lucas PJML@UK.AC.NWL.IA PJML%IA.NWL.AC.UK@UKACRL

1449. Noise-bridge vs GDO??

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-31 12:34:58 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <31.Jul.91.13
Source record: 294831

Using GDO to determine resonance; well thats all very well for antennas that are meant to be resonant... theres a whole family of antennas that do not exhibit resonant behavior (Rhombics, discones, log-periodics, Zepps) and so a GDO will tell you very little about their efficiency at launching RF energy into the ether.
A parallel-tuned L-C circuit can be resonant, but will act as a rather inefficient antenna. Similarly, measuring SWR is meaningless in other cases; a dummy-load can give 1:1 SWR but its serviceability as a radiating device is poor.
Before being able to decide on the best method of optimising any antenna system you have to appreciate how the system is meant to operate, and choose your tools accordingly. My personal favorite is a number of field strength meters, mounted many wavelengths away from the antenna. Just tweak for maximum.
This is possible even if 'many wavelengths' means half a mile or more; i have used a laboratory demonstration galvanometer (with about a 9-inch scale) as an indicating device, and a telescope/tripod to observe it with.

All new hams should be made to repeat the following 100 times:-

'A low SWR is no guarantee of radiation efficiency'

p.s. anyone seeing you setting up such a system may brand you as a looney; 'I saw him carry a big clock down the street, balance it on a gatepost, then he went back to his place and looked at it through a telescope......!'

I am using about 30 feet of thick ethernet between my ICW2A HT and a
Diamond X50 on the top of the house. The center conductor is a solid
gauge 12 and the cable has four shields, two braids and two aluminum foils.
The outside part is teflon.

I have check the installation with a BIRD Meter and absolutly no power
if reflected back in. I am very satisfied with this installation.

I think this cable would be very good for high power installation also.

>
>Has anyone ever tried to use ethernet cable for transmission line???

Do you mean is RG58 (Thinnet) suitable for transmission line?

I _think_ it's merely a matter of characteristic impedance, and projected
loss (a function of frequency, and feedline length)

If that's what you mean, RG58 is indeed suitable, In some/many cases. RG58
has an impedence of 50 Ohms, this is just what you want. However, it is subject
to high signal lose. In the HF bands this won't be as bad, as signal loss
increases with frequency. On VHF it _might_ be suitable for short runs, in
UHF and SHF bands it is entirely unsuitable.

So, if you hoped to take the end of a spool home with you and use it for
radio and you're using HF, then you're in luck. BUT, if you intend to use it
for anyhting other than a 6' or so run to a Mag mount antenna or whatever
for VHF/UHF/SHF, then you're SOL.

>If the post mixer amplifier serves a 50-Ohm load over a wide frequency range,
>and the P8002 does, then I see no need for this compexity.

Why would you allow the post-mixer amplifier to see the unwanted
(F+LO or F-LO) frequency? That's asking for trouble in the post-mixer
amp. The fewer signals it has to handle, the less chance of it generating
an unwanted intermod product. Even if that amplifier has good dynamic range,
allowing the unwanted mixing product to reach the amp adds 3 dB to the
power level the amp has to handle.

So another way of looking at a diplexer is that it is just a filter that
eliminates the unwanted mixing product, plus a circuit that produces a
50-ohm load at the unwanted frequency to keep the mixer happy.

A VSWR of 1:1 means that the bridge sees its own (normally
non-reactive) characteristic impedance at its own terminals
such that there is no power flowing back into the bridge to
tickle the "reverse" diodes. Normally, but not necessarily
that means that there is no power being reflected from the
load. With antennas/transmission lines there is no such
thing as ground or other absolutes, ie RF leaks. K9ALD
tickle the "reverse" diodes.

>
>The difference is the 800-number ham stores are advertised in AMATEUR
>magazines. Non-hams are not likely to "wander in" as they are at a
>Radio Shack.

Seems to me that part of the problem the ham community has had
is an inability to attract new hams. One reason for that (IMHO)
is that we don't offer "Non-hams the opportunity to wander
in to the world of ham radio anymore at all. Back in the 50s/60s we
had an abundance of "electronic parts outlets" that almost always
carried one or more lines of ham equipment. Coincident with that
were the non-ham magazines that often included a "ham" column
and one or more ham "build it yourself" projects. While progress
has been great in terms of technology advances,
we seem to have lost those areas (electronic parts
stores, electronic hobbyists and general "popular electronic"
type magazines) as opportunity areas to foster interest in ham
radio.

Sooooo, I'm glad that Radio Shack is expanding more into the ham
arena (I'd love RS to modify their 10 meter rig so it could
be used on 6 meters). Yes, I hope they will try to have a "reasonable"
approach to how and whom they sell ham transievers, but I
recognize that some equipment may "fall into the hands"
of some unlicensed "riffraff" who will use it illegally.
I think it is up to us to be vigilent of our frequencies and
to take whatever steps may be necessary to keep the
ham bands free of unlicensed/illegal operation.

By the way, in all my years as a ham, I have NEVER been asked for
proof that I was a ham whenever I purchased any ham equipment.

Message-ID: <1991Jul31.143221.13614@linus.mitre.org>
Source record: 294922

I've been a ham since the early 1960's, and like most have graduated from simple, inexpensive gear to fairly modern, complex, high powered HF equipment. Lately, though, I've been having lots and lots of fun with some simple rigs from a bygone era. I found a mint Heathkit DX-20 and an equally mint Drake 2-B, put up a dipole, and have been having a ball on the 40 meter Novice band. I've even been grinding down some crystals to get them on more usable frequencies (away from the broadcasters). This is something like going back to my roots, as this is virtually a copy of my first Novice station. I'm well on my way to WAS on the nostalgia rig. Anyone else out there with classic rigs from the 1950s on the air?

I agree!

Why not go down to your RS store encourage them to point, steer, and direct interested people to your local Ham class or club.

Here will be great source of new Hams.

>
>Has anyone ever tried to use ethernet cable for transmission line???

Standard "CheaperNet" ethernet thin cable is RG58A/U 50 ohm cable.
Even comes with good BNC connectors ready for hook-up! A quick look
into our cable closet revealed: Belden 8259, Saxton 8290, and Lasaur 58.
(Yeah, I never heard of Lasaur either!)

Thick ethernet cable is also 50 ohm. Our is Belden 9880.

The specifications for ethernet cable are found in IEEE 802.3
10 Base-5 (thick) and Base-2 (thin). If it is plenum rated (allowed
to run through crawl spaces without needing conduit), you've got
some good cable. Losses of appropriate cable type apply.

Cheers & 73

>

They are at the top of the band and just above and also just below 14.000. They seem to stay just outside the band where most ham rigs still function. Not a problem for hams until they start to blend into the band. Of course, if they mess around in the DX portion of 20 M they might find it hazardous to their health. Not a threat from me, I'm out of it. Just an observation.

6wks-10wks for surfface mail vs. 3-10 days for air mail.
As to the second Q. "Normaly" if you are sending QSL card to DX station that is a "local" to the place and has a Mng. than SASE is sufficient, however if the case is DX-pedition like ZA or XU than green stamps are in order.

Yes, I'm using it right now on my HF rig. There are several brands
of thick ethernet coax and the type which I like the best it the
Mohawk brand. It's marked as follows:

MOHAWK WIRE & CABLE 12 AWG CL2P (UL) 200'C 0855 BC

It's some of the best built coax that I've ever used. It screws
nicely into a PL-259. It has two layers of Braid and a full 100%
foil shield. The only thing bad about it is that it does not seem
well suited for use in direct sunlight. I keep mine covered by
sheathing it in an old garden hose. The losses seem very low and
the SWR is about perfect. If you can find surplus Mohawk, try it!

>UHF and SHF bands it is entirely unsuitable.

It is usable for other purposes, however: my dummy-load, like many 'ham-budget' ones, have a bad SWR on 70 cm or higher. I connect the dummy-load via 20 meter of RG58 and the SWR is Very Good now, because the power (and the reflections are attenuated by the coax..
Even removing the dummy-load at the end leaves a reasonable good SWR. Not to mention the fact that one needs much more power to get at the power-rating of the dummy-load..

1464. Alinco DJ-160 DTMF Decoder & Stuff

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-31 18:54:27 UTC
From: sdkuo@argo.acs.oakland.edu
Message-ID: <8554@vela.acs.oakland.edu>
Source record: 294833

I have finally figured out how to used the DTMF decoder on the Alinco
DJ-160. Here is what you do:
1) Select the frequency to monitor
2) Put the unit in DSQ mode (FUNC + 0)
3) Unit will decode any DTMF tones it receives and store them in
Dial Channel #3 (but you can't hear anything because you are
in DSQ mode)
4) Press DIAL CH and turn the knob to Dial Channel #3 to view
the decoded tones
I've tried this and it actually works. However, since DSQ mode is
activated, you can't hear anything. The manual (poorly written) says
there is another way (page 27) by just storing digits in Dial Channel
1 or 2 and it will decode any tones received. I haven't tried this
yet.
Other interesting things about this unit that are not in the manual:
1) Unit plays a song when APO is activated and no activity is
detected for 30 minutes.
2) After the out-of-band modification is performed, go into VFO
mode and press the "B" key. This will toggle between 800 MHz,
air, and regular mode. Note that these are useless because
there is no AM detector and the VFO won't lock at 800 MHz,
it's just something extra to play around with.
3) FUNC + LAMP will make the backlight feature stay on forever.
Pressing LAMP again will turn it off.
One last thing, has anyone figured out what the ALM feature is?
The "0" key is also labeled ALM, but I can't find any ALM (alarm?)
feature.

Take a look at the February, 1990 issue of 73 magazine, pages 41-44. The
article describes a circuit which does this. The cost is under $10, not
including the radio or the oscilloscope.

I wonder,mmmmmm. If I walk into a radio shack store and
wanted to buy a radio, and was asked for proof of license,
and then refused to show one, and then was refused the radio
I wished to purchase.....Would I have a case to sue ???

I mean after all, do they ask everyone to show proof or just those
people who don't "look" like their licensed ??? Do they have
proff (i.e. records) to show they ask everyone ??? Besides, the
FCC does not require me to own a license to purchase the
equipment, or even to use it to listen with. As long as I don't
transmit, I have done no wrong. Does RS have the right to exceed
the FCC directives ????Hmmmmm, I wonder
.....

1467. Updated info on the WB3FFV BBS

Newsgroup: rec.radio.amateur.misc
Date: 1991-07-31 20:28:42 UTC
From: howardl@wb3ffv.ampr.org
Message-ID: <1991Jul31.202842.22674@wb3ffv.ampr.org>
Source record: 294842

HOW TO ACCESS THE WB3FFV AMATEUR RADIO TELEPHONE BBS !!!

I have placed a BBS system on-line that is mainly oriented towards the
Amateur Community (but there is other stuff on-line). As of now I have not
attempted to promote this system any place except in the amateur channels
(PACKET, USENET, & word of mouth), and will continue under this policy, as
I hope to keep it oriented toward amateur radio. The various software for
UP/DOWNload is available via telephone dialup and Packet TCP/IP, and through
user support I hope to keep the latest and greatest ham software on-line.
Below is the information that is needed in order to access the BBS via
Telephone -or- TCP/IP, please pass it around to as many ham's as possible.

System Name: WB3FFV
User Login: bbs

Number: (301)-625-0817 -- 1200,2400,4800,9600,19200,38400
(V.32/V.42/V.42bis/MNP1-5)

Number: (301)-625-9482 -- 1200,2400,4800,7200,9600,12000,14400,19200,38400
(V.32/V.32bis/V.42/V.42bis/MNP1-5/HST)

Number: (301)-625-9663 -- 1200 & 2400 (MNP1-5), 9600 & 19200 (PEP)

Data Settings: 8 Bits, NO Parity, 1 Stop Bit
Times: 24hrs/365days (except for routine maintenance)
Software: XBBS (UNIX/Xenix Multiuser BBS) Version 7.91u
IP Address: 44.60.128.1 {wb3ffv.ampr.org} [for FTP access on 145.650 mhz ONLY]
Misc. Info: Machine is an 80486 computer running UNIX V.3.2 and features 800
Meg of on-line storage. Most transfer protocols are available!!

I attempt to keep the latest and greatest HAM software on-line, and encourage
all to upload anything new that they come up with, as it is of benefit to all.
Here is a sample of a couple pieces of software that is available for DOWNLOAD:

KA9Q TCP/IP Software for the PC (Latest OFFICIAL release + TEST Versions)
KA9Q TCP/IP for the Atari-ST, MAC, & Amiga
KA9Q TCP/IP for UNIX based systems
KA9Q TCP/IP (The NOS release) [UNIX, MS/DOS, Amiga]
KA9Q TCP/IP (Version by G1EMM, PE1CHL, PA0GRI, Etc.)
N2GTE Packet Message Switch [GTEPMS] (Version 1.2 & 1.3)
WA7MBL BBS for the PC (Versions 3.31, 4.31 & 5.1[2,3,4])
W0RLI BBS for the PC (Versions 10.xx, 11.xx, 12.xx, 13.xx)
MSYS BBS for the PC running KISS TNC's (Version 1.07-1.11)
AA4RE BBS for the PC (Version 2.11)
Various BBS utilities and enhancements
Several MORSE CODE Tutors
TheNet software by NORD><LINK (Version 1.01 1.16 & 2.06)

Modifications for many HAM Rigs and Scanners
Digital Signal Processing software (DSP)
DX and contesting programs
ARRL Newsletters & Gateway
W5YI Electronic Edition

There is much more available on the BBS, and I don't want to waste a lot of PACKET BBS space trying to list it all, so if you are interested give it a call and see for yourself !!!

If you are interested in using UUCP to connect to the BBS, this can also be done as I support Anon-uucp. The login to the system is 'uucpanon', and there is NO password. The listing of avalible archives are stored in a file called 'FILES', and it is located in the /usr/spool/uucppublic. To retrieve the files listing just use the following command:

uucp wb3ffv!~/FILES /usr/spool/uucppublic

This will move a copy of my files listing into your uucppublic directory. If you have any questions or problems, feel free to contact me at one of the numbers/adresses below. Good Luck...

Date: 1991-07-31 20:37:02 UTC
From: deej@thrush.umesve.maine.edu
Message-ID: <1991Jul31.203702.24199@umesve.maine.edu>
Source record: 294844

I am looking for information on a Kenwood UHF TK-320 radio.
Specifically, when you remove a small rectangular cover located on
the back of the radio, three switch contacts are exposed.
What do these do??
The radio is being used in a commercial environment, and has a pre-programmed
frequency in it, and also seems to be pl tone squelch protected.
I do not know the frequency or pl tone.
Any info would be appreciated, e-mailed to one of the accounts below.

>so, I will try again. As I was handling a piece of THINNET (thin-ethernet,
>cheaper net, 10base2 stuff, etherhose, I think you might get the picture),
>I wondered how it was different from the RG 58 and if anyone had used
>it short-run antenna feed?
>
>73s....Troy(trop)

My experience has been that there are two types of THINNET, cheap and
cheaper. Anything which actually says RG 58A/U on it will generally
be ok. I've seen some stuff which didn't say RG 58 A/U on it but
instead said 30 Volts... It was pure junk. All ethernet coax is 50
ohm, but not necessarily good up into the VHF range and beyond.

>Could I regulate the voltage and the current and successfully charge the
>battery while using it? Is there something hopelessly wrong with this
>picture?

I encountered basically the same problem some years ago. The details
can be found in the ARRL handbook. To address your specific questions:

Yes, it is possible to both charge the battery and operate the
xcvr at the same time. .27 amps won't power the transmitter on high
power, but if you listen a lot, the battery will accumulate enough
charge to transmit. With the ICOM battery packs, you may have to make
some small changes to bypass (or remove) an internal resistor that
limits the charging current to a trickle charge.

Another responder suggested simply using the solar cells to trickle
charge the battery overnight. The sun must keep unusual hours at his
QTH! There aren't many solar cells which work well after dark. :-)

I think there may be more to it than that. Due to certain ordinances,
retail stores and services open to the public are required to sell to
everybody unless they have a sign prominently displayed reading,

"We reserve the right to refuse service to anybody"

or something like that. So the local Radium Shack could be breaking
the law by refusing to sell said radio equipment to Joe Wierdo.

Personally, I hope they sell lots of em'. Better to have lots of
riff-raff to talk to than some few and far between cliquish techno-nerds,
I think. This ain't L.A. There's more inactive mountain top repeaters
than active hams at any given moment.

I don't think so. I don't know of any law requiring a retail
establishment to sell items to a particular person. There are
laws that prevent them from discriminating against certain
groups, but if they are not convinced that you are going to
use the radio in a responsible manner, they probably can simply
refuse to sell it to you. In a similar fashion, if I am selling
a car, I can refuse to sell it to someone who I think is going
to go out and wreck it. But I can't refuse to sell it to him
or her because of membership in a minority group.

1476. Mini transceiver ?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-01 01:48:25 UTC
From: pyroace@sys6626.bison.mb.ca
Message-ID: <e4eZ62w164w@sys6626.bison.mb.ca>
Source record: 294839

I want to make a low-power, single digital channel, CW transceiver. How can I design a small but stable and narrow, transmitter with 300mW output ? I was planning to use a Clapp-shunt-fed-series-tuned type oscillator and then to amplify it, but any other design ideas would be greatly appreciated.
Without getting into PLL or frequency synth. is there anyway to make a very stable transmitter with a narrow bandwidth ?

any ideas welcome. thanks in advance.

1479. Re: Poulsen Arc CW Transmitters

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-01 03:28:34 UTC
From: mzenier@polari.UUCP
Message-ID: <4914@polari.UUCP>
Source record: 294851

In article <14570122@hpnmdla.sr.hp.com> donrm@hpnmdla.sr.hp.com (Don Montgomery) writes:
>Does anyone know how the Poulsen Arc CW transmitter worked? This was
>popular back in the twilight days of spark, and generated a near-perfect
>CW output. It used alcohol for something, anyone know what? Is there
>anyone on the net old enough that knows what one sounded like?

I've got an old book with a chapter on the care and feeding of a
Federal 2 Kw arc transmitter. (Practical Radio Telegraphy by Nilson
and Hornung, McGraw-Hill 1928)

They worked using the negative resistance of an electric arc in
hydrogen gas. (The closest thing today would be a tunnel diode
oscillator or (sort of) a neon lamp relaxation oscillator.)

The arc was fed through a large choke magnet that acted as a ballast
with the choke in the form of a (asymetric) horseshoe with pole pieces
(sort of like an old magnetron magnet) where the magnetic field was used
to stablize the arc. This is what's inside of the fire plug. The
arc composition was maintained by an alcohol drip (or kerosene or
illumination gas). Add to this a water cooling system and the
exhaust gas pressure regulator.

The antenna was coupled to the arc through a tapped coil, in series, and
sometimes a series capacitor. The resonance of the whole thing including
the antenna was used to set the wavelength. Looks like the antenna
was (sometimes) live with the 400 volt arc supply.

The wavelength was from 300 meters (1 Mhz) down to 18000 meters, with
the usual operating wavelengths of 1800, 2100, 2200, 2400, and 3000 meters,
(166 to 100 Khz).

They were keyed in several different ways. 1) Switching the arc between
the antenna tank and another tuned circuit. 2) Shutting the arc on and off.
3) FSK modulating the antenna resonance or 4) Using a motor driven
circuit to FM modulate (at an audio frequency) the antenna resonance
with a chopper circuit and using the key to switch the chopper in and out.
5) Using a motor driven chopper to AM modulate the antenna current.

They were a CW signal, but probably not very clean by modern standards.
It would depend a lot on the the Q of the antenna circuit.

I doubt they were very efficient. In the same book they talk about
200 and 500 watt RCA tube transmitters that look to be set up for the
same size (shipboard) installation.

[Last Modified: 31 Jul 91]

A Brief Historical Overview:

If there is any one constant in the changing state of the communications art, it is that "hams" have always been on the forefront of it. Whether the word HAM originated with:

the acronym "Home Amateur Mechanic" or...

from the Cockney pronunciation of "L'amateur" or...

the initals of the founder of the American Radio Relay League, Hiram A. Maxem, W1AW or...

from the call letters of one of the first amateur stations at Harvard, H.A.M. (please, no flames from W1XM at MIT) or...

some other obscure source, it is universally recognizable as describing one who experiments in radio and communications.

Whether it be constructing a low-power CW radio with vacuum tubes, or designing TCP/IP packet networks, such experimentation has historically spilled over into the mainstream such as was the case with Edwin Armstrong, who developed the regenerative oscillator and FM radio, or General Curtis LeMay (K6LEW) who was instrumental in making Single-Sideband the communications standard for the Strategic Air Command and eventually the U.S. Air Force. Although packet-switching techniques originated with DARPA and the ARPANet (Defense Advanced Research Projects Agency), no one can deny the trememdous influence that amateurs have had in demonstrating the viability of TCP/IP and AX.25 communications via radio links. The efforts of AMSAT (the Amateur Satellite Corporation) including the development of many ham satellites and the low-orbiting microsats (communications satellites no bigger than a breadbox that use store-and forward packet techiques) has certainly "advanced the state of the communications art," one of the defined purposes of the Amateur Radio Service, as recognized by international treaty.

Since in many cases hams are writing "the book", there is often no "book" or other established reference for a beginner to refer to. Traditionally, information has been passed on from ham to ham via word-of-mouth. Like many of the traditional crafts, a variation of the Master-Apprentice system has emerged, the Elmer-Novice relationship. Called "Elmers" because they are usually older and wiser, having the benefit of many years in the hobby, including several failed projects, and an electric shock or two, they have traditionally been the mainstay of the hobby, and the source of many new hams, particularly those interested in working on emerging technologies.

What is an Elmer today?

An Elmer today is of any age, male or female, who has some expertise and is willing to share it with beginners. Elmers don't even need to be licensed amateurs, just people with knowledge in some area of electronics or communications technology.

What is a Usenet Elmer?

With the ever-widening scope of the Internet, and the amateur radio newsgroups on Usenet, the potential for Elmers to share their information to a wide audience has never been greater. To that end, I have started to maintain a list of such Elmers. Volunteers need only send me their name, E-mail address, and area of expertise.

Naturally, the more that volunteer, the more the work is distributed. If upon volunteering, you are unable to meet your obligations, simply write to me and I will remove your name from the list. I could also add that because of "personal committments" or "career broadening" you no longer are available to Elmer on a regular basis.

I will be the point-of-contact for this project. I will maintain the list, post it to the groups on the first of each month, and have the latest copy placed in the supplemental archives at ftp.cs.buffalo.edu in subdirectory pub/ham-radio.

Those desiring a more extensive list, or who need more specific assistance, are encouraged to contact Rosalie White, WA1STO (no arrlhq.UUCP mailbox yet) at the American Radio Relay League, 225 Main St., Newington, CT 06111.

The latest version of the list can be found in the companion posting to this message, "Monthly Usenet Elmers Resource Directory." If you sent me mail and are not on it, please resend as it may have been lost on the way or once it reached my host.

Currently, the list is over 30 Elmers strong, has been featured in informational postings in the comp.archives and news.lists newsgroups, and has become an invaluable resource for many, as well as an opportunity for the volunteers to share their knowledge. Thanks to all the volunteer Elmers, as well as courteous list users, for making this service a success.

>if reflected back in. I am very satisfied with this installation.
>

Ladies and gentlemen, please note that very little reflected power from an antenna installation only shows that you have a good resistive 50 ohm termination. Usually you have a good match in your antenna but you can also have a short circuited or open connection at antenna if you have 100 feet of RG58 at 430 MHz.

>I think this cable would be very good for high power installation also.
>
Yes it is, as it has teflon insulation. Another good point is that it is very well screened.

By the way, does anybody know how thick ethernet cable (e.g. Belden 9913) tolerates weather?

Anybody out there got a clue as to what's up at Gettysburg? Here's the deal:

I upgraded to Advanced on 21 May 91; also passed element 4B at the same session (you might remember the posting I made about it)

Passed element 1C on 13 Jul 91 (i.e., upgraded to Extra)

But I have yet to receive my Advanced ticket in the mail -- 10 weeks and still counting!

W5YI knows that I upgraded, since both sessions were theirs, and I just got a note from them saying that they are holding the Extra paperwork until I send them a copy of my Advanced ticket. I have to assume that they sent the Advanced upgrade in on time...

(Side comment: if the FCC requires the VEC to hold an upgrade when an earlier upgrade is still pending, then what's the point of the block on the 610 which addresses that very issue?)

So what's the deal at Gettysburg? Are they so swamped with Tech applications that their prediction in the no-code docket about a slowdown in processing time is coming true?

Obviously, I've already got a ticket, so I can go ahead and use the /AE, but I hate to see all these bright shiny new faces get dulled because of a 3-4 month wait for a ticket...inquiring minds want to know...

73,
Jeff Miller NH6ZW AFA8JM

I'm a rather new ham (about 3 months) and still learning.

This thread has me confused. On the one hand, the amateur radio community is proud of it's ability to police itself and has a proven track record of accomplishment in that discipline. However, it appears that quite a few are not confident that amateur radio can continue to police itself and must enlist the aid of others that may suffer the loss of business if they should comply.

Agreed, I have exposure to a rather small sample of ham operators opinions here on the net. I wonder though if this is a common belief or if those that lack the confidence are in the minority.

I believe even HRO would sell a rig to an unlicensed person if they had the bucks. Take for instance the wife of a ham who was buying a rig as a present to him would be a very reasonable and proper reason for a unlicensed individual to purchase a rig.

Can somebody please give any information about 500 model batteries. Where can get them? (That's my main concern.) I've checked some most popular stores; people there don't know anything about such batteries. How many volts is one of that kind? Can they be substituted by some other kind? On a cordless phone UNIDEN 300, on transmitter part, there is a sticker under a DC input: "Warning! Use only 500 model battery pack!")

I'd really apreciate any information. Thank you in advance.

>Me too! I have a nifty little Kenwwod that does the job, but have...
>I'm currently swapping between a Viking I, and Viking Ranger...

That Viking Ranger is one sweet little rig. I had one in like-new condition, but like a fool I sold it, and I've been kicking myself ever since. You are dead right about desk space, though; many more vintage rigs, and I'll have to move out. I'm looking for a Davco DR-30 receiver; it was the first all-solid-state ham band receiver, and it was very, very compact. Anyone out there have one they want to part with?

>or something like that. So the local Radium Shack could be breaking
>the law by refusing to sell said radio equipment to Joe Wierdo.

I'll leave it to the lawyers to fight over whether it's legal to refuse service. I don't think it's right, however. I am one of those who don't believe that everything is "someone else's" resonsibility; so I don't agree that RS (or anyone else) should refuse to sell something to someone because of a concern for what the buyer may or may not do with it. Nor do I believe they should be held responsible in the minds of men when the buyer, with no input at all from the seller, violates some law or causes harm with it.

>Personally, I hope they sell lots of em'. Better to have lots of
>riff-raff to talk to than some few and far between cliquish techno-nerds,
>I think.

I almost don't believe that a licensed Ham made this statement. Anyone who wants lots of riff-raff to talk to needs only go to 11 meters. If this notion begins to pick up supporters among the existing Hams and "Hams-to-be" then I'll vote for an extra 50 kHz of each band allotted to CW only.

While you can always find someone to "talk technical" on the bands, you can also find many who are willing to chew the fat about almost any subject. During a QSO, just bring it up yourself; don't wait for the guy on the other end to do it. While not everyone will yak about your favorite thing, you'll find plenty who share your interest(s).

>the FCC directives ????Hmmmmm, I wonder

Jerry's comments bring up the point only alluded to so far in this thread. I.e.: There is no law or regulation against selling amateur radio gear to anyone, irrespective of license.

Someone else pointed out that they'd never been asked to show proof of license when buying amateur radios. Nor have I. Other than the Heathkit catalog and Radio Shack catalog (for their 10 meter ad), I haven't seen notes to the effect that you needed to be licensed.

Despite the occaisional "bash the Shack" campaigns on the net (and I've seen my share of know-nothing clerks), Radio Shack seems to have a fairly good grasp of what it takes to sell into the markets they go into. That's one reason why their stores often have free (or at least low-cost) introductory computer classes. They know the folks who attend those are going to become more knowledgable about computing and are therefore likely to be back to buy more stuff.

If we work with the store owners/managers, the availability of more amateur gear from a easily accessible source should work for hamdom. And if a RS clerk ever asks me if I have a license when I'm looking at one of their radios, I'm going to smile, politely educate him, congratulate them on their concern about proper usage, and ask them if I can leave some flyers about our ARC. If they don't ask me, I'm going to smile, politely educate . . .

>as hell. If I was going to make a major purchase, I'd go somewhere else.
>Customer service is not one of their strong points. I have many friends
>in the local area who feel likewise.

A friend of mine (KB2ES) recently purchased a new Kenwood TS-850S from Texas Towers with a bank check. When the box arrived it was obvious that it had been opened before. The radio showed signs of having been used, the service manual was dirty and creased, and the microphone looks like it had been interchanged with one from a 10-year old radio. When he called them, they denied any responsibility for this happening. Their manner was brusque and condescending. They insisted the box had never been opened by them, even though the invoice was IN the box! After some stronger words from my friend they finally agreed to take the radio back and to return the money, without any apologies or attempts at anything resembling "customer service". They did not offer to replace the radio with another one, stating that they didn't want to do business with customers like my friend...

/ hpctdlb:rec.radio.amateur.misc / waters@nddsun1.sps.mot.com (Strawberry Jammer) / 12:10 pm Jul 30, 1991 /
I am in the planning stages for a vacation trip to Hong Kong and Macau this fall. This is a frequent flier bonus, so I don't have a lot of excess cash nor much flexibility in schedule. It will also be my first visit to Asia.

I have contacted ARRL about reciprocal operating and HKTA about general advice. My questions:

1) Is there a club or contact in either country who could help me do som HF DXing.Both countries are moderately rare and I would like to try DX from "the other end"

So far my plans are to take only my 2M/440Mhz radio, my HF gear is too large to take.

2) Any advice on what to see/avoid?

The concensus so far is not to bother trying to find "bargains" because U.S. discounters have as good price but with US warranties.

I have been to Hong Kong several times in the last 5 years, and each time did some "bargin" hunting for Ham stuff. You will find that most every "camera" shop also has some 2M and 450 HTs. If you are in the market for a particular radio, be sure to know the best local price you can get in the US. That will let you know if you are finding a good deal. Second, there are very few salesmen in Hong Kong that know about radios, so beware. Most stores carry many versions of the same radio (eg IC02AT, IC02E, IC02N) that match the band plans for different countries. Make sure of your suffixes. You will also find a very W-I-D-E range of prices for the same radio.

One one other point, one of my local Hong Kong contacts tells me that it is not legal to own a 2-way radio in HK. I have not verified this through official channels, but EVERY store that sells ham equipment has a prominent sign that says "FOR EXPORT ONLY."

Good luck on your travels. Feel free to E-mail me with other questions.

IF R=50 ohms, then a VSWR=1:1 would indicate resonance. BUT, what if
X=25 ohms and R=25 ohms. You would still have a 1:1 VSWR as seen by the
transmitter, but the antenna would not be resonant. The common dipole,
for example is not a perfect match for 50 ohm coax. If you prune a
dipole to exactly a 1:1 VSWR, it will be slightly off the resonant
frequency.

>Advanced upgrade in on time...
>

Jeff, I'm Steve, NS5I, and I work in the W5YI organization ("official" title: assistant VEC). Although I do not directly handle the FCC paperwork myself, I write the VEC instruction manual for W5YI (the guidebook for all W5YI VEs) and I have been the contact VE for more than 50 examination sessions.

Did you upgrade to Advanced from another license class and did you already have the FCC-printed license in your posession when you went to the upgrade session? If not, you probably had to send in a copy of your previous license before your Advanced ticket could be processed and this would add considerable delay time to your receipt of Advanced. In any case, your examining VE team has 10 days time to process the exam session paperwork and get it in the mail to W5YI-VEC. Then, the US Mail takes its own good time to deliver it to Dallas, TX. When W5YI-VEC receives it, we have 10 more days to process the session and mail the results to the FCC. (Again, any US Mail transit time is added.) The FCC has no set time limit to process your application (although 4 weeks is typical), then they US Mail it back to you. Total time: up to 20 days plus FCC delay time plus three US Mail delay times.

Unfortunately, the FCC has a rule that disallows more than one license application per person from being in their "mill" at once. This means that the VECs (including W5YI) are required to handle the burden of keeping track of whether or not an applicant has something in the FCC works or not. If so, they are required to hold the application until EVERYTHING (including a photocopy of any current license) is all together, THEN AND ONLY THEN are they allowed to send in the next upgrade.

>(Side comment: if the FCC requires the VEC to hold an upgrade when an earlier
>upgrade is still pending, then what's the point of the block on the 610 which

>addresses that very issue?)
>

These blocks are used by W5YI-VEC to let us know you have an upgrade pending. It's our method to help us keep track of applications which must be held for later processing. (Other VECs may work differently.) I think these blocks were holdovers from earlier 610s when the FCC did all the processing themselves.

You're right, the FCC is VERY busy with all the Codeless Tech applications. They have only two full-time persons and one part-time person to work on ALL amateur applications and the popularity of Codeless Tech has increased their workload considerably. Budget constraints being what they are, it isn't likely that there will be any additions to their department, so look for even longer delays in the future. (BTW, one of the things that can be done to help them out is to write on your 610 in LARGE BLOCK LETTERS in BLACK INK.)

>iambic or otherwise.

Such a key is called a bug. The best known source of these is Vibroplex, located somewhere in Maine, if memory serves me. They have been in business for a long, long time. Although I no longer regularly use my old Vibroplex Blue Racer Original, complete with carrying case and extra silver contacts, it was an antique when I bought it in 1972 at the Dayton Hamfest :-) For the true afficionados, there are even ways to date the old bugs by their serial numbers. I never researched mine, though. The first bugs were used on the old railroad land telegraph lines, in the 1880's, and perhaps before. They were invented shortly after Morse invented the telegraph! The reason, of course, was to avoid the condition known then as 'glass arm', but perhaps better known now as tendonitis. With this condition, you could not send code quickly, and your career as a telegraph operator would be over unless you switched over to a bug.

To combat the same medical condition, BTW, there were also side-to-side keys made known as sideswipers, and these required the user to waggle from side-to-side for both dots and dits. I have only seen a few of these that date from the proper era. Today, they would be just another set of paddles (Bencher or W8YO, or whatever :-)

Interestingly enough, the first keyers were often referred to as electronic bugs. Guess we have come full circle to mechanical keyers :-) Keep on brass pounding! (BTW, I use Bencher paddles and the Super CMOS Keyer (original, not the more recent II) from QST.

1508. Kenwood TS-450

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-01 21:10:16 UTC
From: dwilson@s850.mwc.EDU
Message-ID: <9108012107.AA07057@ucsd.edu>
Source record: 294875

I was informed today that although the TS-450 is in the country,
the FCC has refused to type accept it. The problem is that it will
transmit above 30 MHz. Rumor has it that the pressure is from
Motorola who previously informed the FCC about some western city
FD that was using other Kenwood equipment on its licensed frequencies
even though the equipment was not certified for such. Anyway,
reportedly Kenwood has not yet decided how to cure the problem
and others like me who have ordered one are advised there should be some
word in a week or two.

NEWS RELEASE

For immediate distribution

The Antietam Radio Association of Hagerstown, Maryland, W3CWC, will present the 1991 Maryland-DC QSO Party this summer. The contest will run from 1600 UTC August 17 to 0400 UTC August 18 _AND_ from 1600 UTC to 2359 UTC August 18.

[In other words, the contest will run from 1600 UTC August 17 to 2359 UTC August 18 with a 12 hour break from 0400 UTC to 1600 UTC August 18.]

MODES : PHONE AND CW/RTTY/DIGITAL

* Stations may be worked _ONCE_ per band using each mode.
* CW contacts may only be claimed if the QSOs was in the CW portion of the band.
* Non-Maryland/DC stations may only claim Maryland/DC contacts for scoring.
* Maryland/DC stations may work any other amateur station.

Portable and mobile stations that change Maryland counties [or states] during the contest count as a separate station in each new county [or state] of operation. Contacts through a repeater do _NOT_ count for scoring purposes. [Repeaters may be used to set up skeds with other stations, however.] All other HF/VHF/UHF contacts do count.

EXCHANGE: Signal Report, QTH _AND_ the MAJOR CATEGORY OF ENTRY.

* Signal reports should be in the standard "RST" format.
* QTH for Maryland/DC stations is either the Maryland county, "DC" for Washington, DC or "Baltimore City" for Baltimore City.
* QTH for non-Maryland/DC stations is either the US state or country of operation, if DX.
* Major Categories are: CLUB, QRP, MOBILE, NOVICE, TECHNICIAN, YL (XYL) AND STANDARD (for all others).
* Use only the one major category for your station.

SUGGESTED
FREQUENCIES:
* SSB: 1.860, 3.920, 7.265, 14.280, 21.370, 50.150 and 144.550 MHz.
* CW: 3.643, 7.060, 14.040, 21.115, 28.060 MHz. Suggested CW listening times are on the odd half-hour, i.e., 1730, 1930, 2130, etc.

SCORING: QSO POINTS
---

* Each simplex phone QSO counts as one point.
* Each simplex CW QSO (including RTTY/digital) counts as two points.
* For Maryland/DC stations, each QSO with a mobile station counts as five points.
* Each QSO with a club station counts as 10 points.

N.B. The highest point value applies, e.g., a CW/mobile contact counts as five points or a CW/club contact counts as 10 points.

MULTIPLIERS
---
* Multipliers may only be counted once; _NOT_ once for each band.
* For non-Maryland/DC stations, each Maryland county, Baltimore City and Washington, DC are multipliers. -- N.B. maximum 25.
* For Maryland/DC stations, multipliers are: Maryland counties, Baltimore City, the District of Columbia, each of the 49 other US states and one for DX -- N.B. maximum 75.

BONUS POINTS
---
* Mobile stations may ADD 100 bonus points to their raw score for each Maryland county/Baltimore City/DC they work outside their home locations from which 20 contacts were made.

FINAL SCORE:
* QSO Points X Multipliers + Bonus Points = Claimed Score

AWARDS:
* High score verified for each US state, Canada or DX;
* Top three Maryland logs;
* High scoring Maryland/DC club;
* High scoring Maryland YL (XYL);
* High scoring Novice;
* High scoring Technician.

CERTIFICATES:
* For each station with at least 100 QSO points;
* To the best SWL log (N.B. Must not be a licensed amateur radio operator.);
* For the highest scoring QRP station.

The decision of the judges is final.

The committee reserves the right to issue additional awards and/or certificates if deemed appropriate by the Antietam Radio Association.

Logs should be postmarked no later than September 10, 1991 and mailed to:

Antietam Radio Association
P. O. Box 52
Hagerstown, MD 21740

USA

Attn: MD/DC QSO Party Contest Committee (Log Enclosed)

Logs postmarked later than September 10, 1991 will _NOT_ be processed.

Be sure your log indicates your complete exchange information and your major category of entry, i.e., CLUB, NOVICE, MOBILE, QRP, TECHNICIAN, YL or STANDARD.

Any questions may be directed to:

WA3EOP
Contest Chairman MD/DC QSO Party
W. Page Pyne
109 South Artizan Street
Williamsport
Maryland 21795
USA

If you would like a complete listing of the results of the contest, send an SASE to the MD/DC QSO Party Contest Committee at the Antietam Radio Association address above.

1510. "Standard" 12V Power Connector?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-01 23:18:37 UTC
From: alanb@hpnmdla.sr.hp.com
Message-ID: <14570127@hpnmdla.sr.hp.com>
Source record: 294780

Awhile back, there was a string devoted to the pro's and con's of using Anderson PowerPole (TM) connectors as a "standard" connector for the 12 V power input of amateur VHF FM transceivers. It was stated that this connector had been selected as the recommended standard by RACES in California and elsewhere. I talked to our local RACES Radio Officer, and he had never heard of it. In fact, he was opposed to the idea on the grounds that this is an "oddball" connector not easily available to the average ham.

In the latest issue of "ARRL Field Forum" it states:

"As a result of a study commissioned by the League's Volunteer Resources Committee last year, the Field Services department is recommending the MOLEX Series 1545 connector for use in promoting compatibility and interchangeability among personal VHF/UHF radio equipment at disaster and public event sites. Polarity should always be verified prior to connecting radios and power supplies."

[Drawing of two 2-conductor connectors. The "pointy" end is the + connector, the flat end is the - connector. The male plug with female pins goes to the power source. The female plug with male pins goes to the rig.]

"The 1545 connector is rated at 25 volts, 8 amps. Wire size requirement is #18 AWG or greater. An in-line fuse between the power source and the first connector is recommended. The connector is available at Radio Shack stores, part #274-222."

Sounds like just the thing. I have noticed that many hams are using this connector already.

Has anyone experienced or is having problems with the Yaesu FT-4700 going bonkers when the face plate get hot? I got the faceplate located near the right knee under the intrument panel cluster in my car. The main box is under the back seat. Anytime I get into my parked car during the sunny day, the radio goes wacky. If anyone has a good suggestion... Please E-Mail it to my address. I tried keeping the faceplate under the seat while its parked but the faceplate gets warm enough to go wacky...

1513. Receiving Voyager beacons

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-02 02:15:56 UTC
From: monta@image.mit.edu
Message-ID: <MONTA.91Aug1211556@image.mit.edu>
Source record: 294876
Cross-posted to: sci.space,rec.radio.amateur.misc

The book "First Contact", Ben Bova, ed., talks about amateur SETI and mentions an interesting test case, namely Voyager 2's X-band beacon. Unfortunately, the data is very sketchy---although the authors imply that the signal should be detectable with three-meter dishes, reasonable integration times, and order of 10 Hz bandwidths, they present no link budgets for this case.

Now, this is pretty interesting. I'd be thrilled to see Voyager's beacon. I have a PC, a DSP board, and some signal processing experience, and the RF hardware can't be *that* difficult. :-) What I'd like to see (or obtain references to) is detailed RF specs for Voyager and other interesting outside-Earth-orbit craft:

--- What is the nominal frequency of the downlink?

--- What are its spectral characteristics? Specifically, is there a component with very high spectral density, i.e., carrier? (For that matter, is it normal practice to transmit a pure CW beacon apart from the telemetry link?)

--- Reasonably precise ephemeris, to allow Doppler calculation to put carrier within the perhaps 20 kHz bandwidth of processor

--- What is the radiated power, transmitter antenna gain, pointing loss, etc.?

I suppose local oscillator accuracy might be important, also: 10 Hz at X-band is 10^-9. The authors don't discuss this in detail, but for sure unlocked TVRO-style DSO's will not do the job. (There is amateur literature on phaselocked Gunn sources for narrowband receiver applications). Transmitter accuracy/stability might also be of interest.

Seeing as the book is a year old, has anyone done this?

1514. WANTED: Communications tapping info

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-02 04:26:58 UTC
From: snarler@MAPLE.CIRCA.UFL.EDU
Message-ID: <30233@uflorida.cis.ufl.EDU>
Source record: 294793
Cross-posted to: sci.electronics,rec.radio.amateur.misc

In writing an article for a future publication, I've found the need to get info on several methods of radio communications "tapping".

Namely, I'm interested in the specifics of how cordless phone radio broadcasts can be picked up (such as what frequency, what sort of receiver used, etc.), which is partly in regards to the Feds ruling on letting the IRS spy on people this way.
I'm also interested in methods used to scan celluar phone broadcasts, such as frequencies, equipment, etc. Any info on how cellula phone transmissions can be (and/or are) scrambled/encrypted is also appreciated. Any specific methods of transmission protection is also appreciated.

DISCLAIMER: I am *NOT* looking for this information for personal use. I'm not into spying on people. I don't have the time or money even if I had the inclination. But I do want to write an informed and informative article, to get across the point of how careful we must be about our supposedly-private communications.

Any responses should be MAILED to me. I do not regular read these newsgroups. If you can not mail to me, don't reply on the newsgroups and waste bandwidth. Thank you.

Source record: 294787
Cross-posted to: aus.radio,rec.radio.amateur.misc

I'm having trouble with this rig. Basically it gets its memories scrambled following a power glitch, such as starting the car, or jiggling the off switch. The display inevitably shows "6140", and stepping up/down gets you strange frequencies ending in "4" or "9". All memories get this frequency.

The backup battery appears to be OK (it survived lack of power for about 3 months), and I can never reproduce the problem when I need to. I've studied the power-fail/restore circuits, but not being able to reproduce the problem at will, I can't do much.

Has anyone else come across this problem? Talking to other owners it appears to be fairly common, and someone theorised that a timing electrolytic needs to be increased.

Geez, that's exactly how I do it. I guess I won't have to do any
rewiring, hi.

>"The 1545 connector is rated at 25 volts, 8 amps. Wire size
>requirement is #18 AWG or greater. An in-line fuse between

One note, though. Like the quote above says, that series is only
rated at 8 amps. Using these connectors with 50+ watt rigs/amplifiers
probably isn't a good idea. There is another series of Molex
connectors (don't remember the number) that RS sells as the
"heavy-duty Molex" series, that are rated at 20 amps. Using these with
12 gauge wire has served me well. Trying to find 2-conductor 12-gauge
small-strand polarization-marked cable isn't too easy, I'm afraid.
The stuff Icom uses on their VHF/UHF base stations (God, I hate that
term) is perfect - anyone know where I can get more? No, I don't
want to order a bunch of Icom cables at $25 each...

This may be true, but it is an insulting and demeaming comment on hams to
insinuate that they cannot obtain any piece of hardware not advertised in
QST or the AEA and HRO catalogs.

8 amps is distinctly marginal for any radio. My IC-47/A is rated at 7 amps,
my Kenwood TM-731A at 11 amps, the FT-4700 is 10 amps. Forget powering an
HF rig. Furthermore, Molex (Waldom) connectors have an annoying tendency
to burn up because the mechanical contact becomes loose and resistive, which
can't be fixed because the pins are made of very thin metal. Also, because
of the loose tolerances for pin fit, both male and female connectors can
easily short to external metal components or ground. At 8 amps, you will
get almost 1 volt of drop in a 10 foot patch cord made of #18 wire.

I, for one, would rather spend a few days finding a PowerPole connector.
The rest of you can contribute to the stereotype of Hams being too cheap
to do anything right. { :-) ? }

1518. Sending Signals to Aliens

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-02 07:24:33 UTC
From: vac+@cs.cmu.edu
Message-ID: <1991Aug2.072433.1621@cs.cmu.edu>
Source record: 294791
Cross-posted to: sci.space,rec.radio.amateur.misc

It seems that even with Arecibo (1,000 foot dish) we would not be able to pick up signals from a planet exactly like Earth around a neighboring star (let alone farther stars) unless there was somebody sending signals intended for us. So I did a bit of calculation to see how extensive a transmitter it would take.

I am told that Arecibo can pick up a 1 GW isotropic CW beacon at 10 parsecs. Since:

1 parsec = 3.258 light years = 3.086 EE 16 m

this means that Arecibo can pick up a signal that is:

$$\frac{1E9 \text{ watt}}{4/3 * 3.1415 * (10 * 3.086 EE16 \text{ m})^2} = 2.5 EE\text{-}27 \text{ watts/sq-meter}$$

I have an advertisement for a 16 foot dish that has azimuth and elevation motors (DH Satellite (608) 326-4233). It does not list the price but my guess is in the $3,000 to $6,000 range. It indicates the signal beamwidth is about 0.33 degrees.

When transmitting to something 4 light years distant this would mean that the energy would spread out over:

Pi*(sin(0.33/2)*4 ly)^2 = 4 EE28 sq meters

Now taking the area at 4 light-years distance and multiplying by the needed energy concentration:

2.5 EE-27 watts/sq-meter * 4 EE28 sq meters = 100 watts.

So if we had a 16 foot dish with a 100 watt transmitter, then an Arecibo equivalent 4 light-years away could pick up our signal. My ham radio license is good up to 1,500 watts!!!!!

The net result is that someone with a bit more money than I, and their own land, could set up a transmitter that could hit starsystems with enough power that our level of technology could pick up the signals. A computer could have it switch from star to star sending for 15 minutes each or something. It could also be careful never to hit any Earth satellites.

Anybody out there interested in saying "hello" for Earth?

As for the worry that they might come and conquer us, well, I doubt it very much. It seems to me that the more advanced a civilization gets the less useful carbon-based-slaves would be. It is really hard to force

people to think and manual labor is just not going to be worth much with amazing robots. If they are advanced enough to come take us over, my guess is they can make such amazing robots that we would be no use to them.

If there was a VLBA on the far away planet then the power needed to hit them would be even smaller. Does anyone know watt/sq-meter numbers for any VLBA systems in use?

-- Vince

Here is a sanity check:

Home equipment can pick up a 10 watt TV signal from 22,000 miles away using a 3 foot dish (using best home LNB). Since this signal covers the whole U.S.A (say 2,000 by 2,000 miles) that comes to something like:

$$\frac{10 \text{ watt}}{3{,}000 \text{ km} * 2000 \text{ km}} * \frac{1 \text{ sq km}}{1{,}000{,}000 \text{ sq m}} = 1.7 \text{ EE-12 watt/sq-meter}$$

Arecibo has about 100,000 times the area than this 3 foot dish. Also going from a high bandwidth TV signal to a CW (Morse code signal) adds another factor of something like 5EE6. So this would get us up something like 3.4 EE-24 watt/sq-meter. Since I am sure that Arecibo uses a much more expensive LNB, the 2.5 EE-27 watts/sq-meter seems reasonable.

1520. Ham license & foreign-gov't rep job

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-02 13:38:59 UTC
From: wmartin@stl-06sima.army.mil
Message-ID: <9108021340.AA02580@ucsd.edu>
Source record: 294792

From the ham FAQ:
** Who can become a ham in the United States?
Anyone who is not a representative of a foreign government can
be an Amateur Radio operator in the USA. ...

What happens if someone who already holds a ham license gets a job that is defined as "the representative of a foreign government"? I believe I have heard such positions as a lobbyist for a foreign nation is so characterized; it might also apply to a lawyer representing a foreign government in some court case, perhaps. Can they retain their ham license during the period they perform this job, or are they legally required to turn it in to the FCC, or can it be held in "hiatus" and they do not operate during this period, or what?

This may not be as esoteric or unlikely as one might think. I seem to recall that Glenn Hauser (the guy that does the World of Radio broadcasts and published a couple SWL/DX magazines), who had been doing a regular DX segment on the DX show aired on Radio Nederland at the time, had some fuss regarding being considered a "representative of a foreign government" -- the Netherlands -- when he was inducted into the USAF during the Vietnam unpleasantness. It affected his security clearance processing. [He was paid by an agency of the Netherlands government for doing that DX segment. He also had problems cashing checks made out in guilders in the various parts of the midwest he lived in at the time... :-) In case anyone cares, Glenn ended up working at AFRTS in Thailand during his stint in the Air Force. There was an AFTN that was the Thai equivalent to AFVN in Vietnam...]

I've always been amazed at how slow information travels concerning good and bad businesses. The most rude stores (anything from groceries to swimming pools) seem to stay in business. The nicest people on the block seem to stand as good a chance as anyone of going under. So I've always tried to give my business to friendly people even when it cost me more.

Thus I am delighted to see the good and the bad comments here about dealers. I just wish there were ways to spread these messages farther. There's no reinforcement of customer satisfaction like increased or decreased sales. Unfortunately, I suspect the internet reaches a very small and esoteric portion of the ham radio community.

I have an ICW2A dual bands ICOM and I would like to decode received DTMF tones,
can it be done? and how?

Clem.

I can't really speak for Texas Towers, but I will note that they certainly
wouldn't have anything to gain by shipping out a used radio for a new one!
These days packing slips/invoices are _almost_ universally pouched and
attached to the outside of boxes (it is not cost effective to open up boxes,
enclose invoices, reseal the box, address it, etc as distinct steps). In
fact, your friends radio _may_ have been waylaid somewhere along the line.

Of course, this does not excuse the attitude displayed by Texas Towers. If
they felt like this radio being returned was not the one they shipped, there
are better ways of handling the problem. It sounds like the manager there
needs some new, more highly customer oriented people on the phones!

P.S. I'm not dismissing the possibility TT shipped the wrong radio.

In the R/C world (planes, cars, boats) this is also known as the
Sermos connector. I don't have the ratings in front of me, but
I think the rating was 20 amps? My dad has all of his gear set
up this way and really likes it. That way he can put any radio
in his truck and only use one connector. I think he even has
his TS-430 hooked up this way.

The Sermos can be found at almost any good R/C hobby shop. This
is certainly more common than some ham stores.

'tis just my little bit.....

Vince:
> 1E9 watt
>---------------------------------- = 2.5 EE-27 watts/sq-meter
>4/3 * 3.1415 * (10 * 3.086 EE16 m)^2

Oops. That "4/3" should just be "4", so we really get:

8.3 EE-28 watts/sq-meter

And so:
>2.5 EE-27 watts/sq-meter * 4 EE28 sq meters = 100 watts.

Should be just 33 watts!!!!

A focused 33 watt transmitter (16 foot dish) in a nearby starsystem is
something we could pick up, while we could not pick up general radio
signals equal to Earth's at that distance.

Any other mistakes?

I didn't read that book, but I thought that Voyager was so far out now NASA has to use very elaborate synthetic aperature techniques with 100ft.+ dishes to receive the downlink. I'd be very surprised to learn that one could receive it on a single dish of such small dimensions. Post the info if you get any hard facts on it. Thanks...

>Anybody out there interested in saying "hello" for Earth?
>

I think we already are! There was an atricle in Science a while back that observed that UHF TV stations make beacons that should be detectable in intrastellar distances. A full power UHF TV station runs 2-3 Megawatts ERP, with an antenna pattern shaped like a narrow disk pointed at the horizon. (Yes, some mountain top sites use pattern steering to depress the dish below the horizon, and some sites use horizontal as well as vertical directivity, but most stations are interested in covering as many sq. miles as possible.) In any case, our alien viewer would get a blast of UHF TV radiation twice a day as the earth's rotation swings the antenna pattern by him/her/it. Twice, that is, from each station. How far do your calculations show that such signals should be receivable by an Arecibo-class facility? Note that you don't need to consider a 4.5 Mhz bandwidth - how about a fairly narrow receiver tuned to the carrier and the first few vertical sync harmonics. Note that these signals are not beamed to a single star, but are swept through largh swatches of sky daily.

Let's hope that our alien is at least tuned to PBS and not to I Love Lucy reruns...

Yes, I've already standardized all of my low power 12V equipment on
this connector and amazingly, with the same gender and polarity as
stated above. I made the change independently, without suggestion from
others based upon the plug's ready availability and good mechanical
design. I simply used common sense when selecting the polarity and
gender. It seems that this plug is a 'natural'. At $.99 per connection,
it's cheap too.

Yup, Tonga is right. A3 is the actual prefix. the 5 is just part of
the callsign. In theory A30 through A39 would all be in Tonga.

BTW, Are you sure that wasn't A35CA you worked? I worked Carlo, (I4ALU) just
a couple days ago on 15 cw, and heard him again the other night. He's been
quite active. In World Radio News (I think) I read that he's going to
be operating from a few South Pacific islands this summer. I also worked
him as 3D2CA a week ago.

Any uncomprehensible errors is probably due to the laser scanner and
the accompaning translation software.

****

THE WAA GROUP 4/91

P A C T 0 R Short system description

1. Introduction

AMTOR and PACKET RADIO (PR) have become rather popular ARQ techniques
in Amateur Radio. Nevertheless, concerning poor-quality channels,
their performance is far from optimum. AMTOR, matched to old mechani-
cal teletype technology, represents the state-of-the-art some 20 years
ago; PR was adopted from the X.25 protocol for data exchange on high-
quality telegraph lines.
PACTOR (PT), specially designed for operation in noisy and fluctuating
channels, is an improved half-duplex synchronous ARQ system combining
the reliability of PR with the fixed AMTOR time frame.

Principal design considerations:

PACTOR comprises all important AMTOR or PR (2-way) characteristics:

- fixed timing structure and full synchronism to ensure maximum speed
- fast and reliable changeover / break-in
- required bandwidth less than 600 Hz
- 100% ASCII compatible (true binary data transmission)
- extremely low probability of undetected errors (16 bit CRC)
- independent of shift polarities
- no multi-user overhead in a narrow-band channel
- inexpensive hardware (Z80 single-board)
- high operational comfort (built-in message storage system, etc.)
- listen-mode (monitor)
- FEC-mode (CQ-transmissions etc.)

As a novelty in Amateur RTTY, some additional powerful features have
been realized:

- optional coherent mode, i.e. system clocks locked to frequency
standards (e.g. DCF77, TV deflection signals and other high preci-
sion broadcasts)
- online data compression (Huffman coding)
- automatic speed change (1001200 baud) without loss of synchroniza-

tion
- fully acknowledged link termination (no QRT-timeout required)
- memory ARQ (even noisy packets can be restored)

II. Some system details

1 . Timing

The basic PT transmission frame is very similar to AMTOR; blocks (packets) containing data information are acknowledged by short control signals (CS) sent out by the receiving station.
Shift levels are toggled with every cycle in order to support memory ARQ (see below). Since the shift polarity is clearly definined at synchronization time, any conventions concerning 'mark / space' become obsolete.

cycle duration 1.25 sec
packets 0.96 sec = 192 (96) bits at 200 (100) baud
control signals: 0.12 sec = 12 bits, each 10 msec long
CS-receive gap : 0.29 sec

Change of transmission speed only alters the internal packet structure; all other timing parameters remain constant.

2. Packets

General packet structure:

/header/..20 (8) data bytes at 200 (100) baud../status/CRC/CRC/

header This byte enables fast synchronization and delivers auxiliary information (memory ARQ, listen mode)
data arbitrary binary information
status system control byte (2 bit packet number, tx-mode, break-in, request, QRT)
CRC 16 bit cyclic redundancy check based on CCITT polynomial X^16+X^12+X^5+1, calculated over the entire packet (except header)

3. Control signals (CS)

Four CS are used. As a compromise between reliability and fast detection, a CS length of 12 bit was chosen.

CS1: 4D5, CS2: AB2, CS3: 34B, CS4: D2C (all hex numbers, LSB right)

The mutual Hamming distance is 8 bit, thus minimizing the chance of receiving a false CS. CS1/2 and CS3/4 form symmetrical pairs (bitreverse patterns).

CS1..3 have the same function as their AMTOR counterparts; CS4 serves as the speedchange control. In contrast to AMTOR, CS3 is transmitted as head portion of a special changeover packet (see below).

4. Starting a PACTOR contact

The calling station ('master') sends special synchronization packets:

/head (100bd)/..address (8 bytes, 1OObd)../..address (6 bytes, 2OObd)/

Normally, the receiver only uses the 100-baud-section to achieve a fast synchronization. The 200-baud-section supplies additional information about the channel quality: if it is received correctly, the first CS will be CS4, otherwise CS1 is sent. After in turn having synchronized a CS4 or CS1, the master will continue with sending normal data packets at 200 or 100 baud, respectively. The first transmitted characters contain the 'system level number' (PACTOR software-version), followed by the master address (callsign).

5. Changing the transmission direction

Similar to AMTOR, the receiving station (RX) can change the transmission direction whenever it has received a valid packet. For this purpose a special changeover-packet is transmitted, starting at the CS time frame. The transmitting station (TX) will switch to RX mode immediately after it has received the CS3 which forms the first section of the changeover-packet. It then reads in the rest of that packet and transmits a CS (CS1 and CS3 = acknowledge, CS2 = reject) timed at the last three bytes of the former packet frame. To force a break in, the TX sets the BK-status-bit (this corresponds to AMTOR '+?').

6. Speedchange

Speeddown only being useful in poor conditions or at low data input rates (e.g. manual typing), both directions are treated unsymmetrically .

i) Speeddown

The RX may request speeddown after any incorrectly received packet by sending CS4, which immediately forces the TX to build up 100-baud-packets (any unconfirmed 200 baud information is repeated at low speed) .

ii) Speedup

Any valid packet may be confirmed with CS4, forcing a TX speedup. In case the following high-speed-packet is not acknowledged after a number of tries, the TX will automatically perform a speeddown.

7. Termination of a PACTOR contact

Cutting an ARQ link inevitably leads to the problem that information has to be transmitted without final acknowledgement. PT applies special QRT packets, providing an expensive but rather effective solution. These packets contain an active QRT status bit and the RX address in byte-reverse order (low speed pattern). If this address is found during the standby synchronization procedure, the RX responds with a single transmission of the final CS (The timing relations before stby are stored). This method will always guarantee a well-defined QRT.

8. Data Compression

Character frequency analysis of typical english or german texts shows that the average amount of information per character does not exceed 4 bits. For that reason, ASCII text transmissions often carry a redundancy of 50%, which could be avoided by using a variable length code matched to the character distribution. The most popular example of such a code is the Morse code; PACTOR data compression mode applies Huffman coding with nearly optimum efficiency, yielding up to 100% speed gain. Every packet contains a compressed data string; character code lengths vary from 2 to 15 bits.

9. Memory ARQ

In conventional ARQ systems the TX has to repeat a packet until it has been received completely error-free. It is evident that the probability of receiving a complete packet dramatically decreases with lower S/N ratio. The only way to maintain the contact in that case is to shorten packet length and/or to apply error correcting codes which in turn will greatly reduce maximum traffic speed when conditions are good.
The method chosen by WAA Research Group is to sum up corresponding bit samples of subsequent packets and to test if the mean value (reduced to a 0/1-decision) passes the CRC. To keep quantizing errors small, the samples are taken from the FSK-demodulator low-pass-filter output by means of an 8-bit AD-converter. Assuming white Gaussian noise, this accumulation method - also known as 'memory ARQ' - will obviously converge even at a low S/N ratio. Furthermore, since shift levels are toggled with every transmission, constant interfering signals within

the receiver passband will not affect the resulting mean value. To prevent accumulation of old request packets, the header is inverted with every new information packet, thus serving as a RQ indicator (similarity test).

10. Listen Mode (Monitor)

This mode resembles Packet Radio monitoring: the receiver scans for valid packets which are detected by CRC match. This 'brute force' method was chosen in order to ensure maximum flexibility, although it consumes a considerable amount of the available CPU capacity.

11. FEC Transmissions

CQ and bulletin transmissions are supported by means of a special non-protocol mode. Packets are transmitted with one or more repetitions; the CS receive gap is omitted. Since the listen mode does not require synchronization, the transmitting station possesses great freedom of selecting packet repetition rate and speed.

12. Practical Aspects

The first PACTOR programs were running on 'breadboarded' Z80 single-board-computers. These early experiments led to the development of a

stand-alone 'PACTOR-Controller' with built-in modem and tuning-
display. The conventional operating modes BAUDOT and AMTOR were added
in order to maintain compatibility and - what might be more intere-
sting - to allow easy comparisons. Assuming typical conditions, PACTOR
traffic can be expected to run 4 times faster than over a AMTOR link.

PTC, The PACTOR-Controller

After a long period of development and test...

The hardware for the new ARQ radioteletype mode called PACTOR, presented
in the German HAM-Magazine cq-DL 11/90, is now available. The PTC
consists of two boards, the mainboard (100 x 160mm) and a frontpanel.
It has the following features:

* Modes: PACTOR, AMTOR (ARQ, FEC, Listen), RTTY.
* Special features of PACTOR:
- Error free data transmission, 4 times faster than AMTOR
- Complete ASCII dataset on one level available
- Memory-ARQ, bad data packages are restored
- Online data compression (Iluffman Algorithm)
- Automatic speed adaption depending on RF-conditions
(100 Bd, 200 Bd)
- Unproto mode (FEC)
- Listen mode (to observe PACTOR QSOS)
- CW identification every 7 minutes and at QRT
* Connectors: RS232, Power, Transceiver
* Power supply: 9... 14VDC, 2OOmA
* Developed in CMOS/HCMOS technology as far as possible
* Digital tuning control: 8 LEDs
* Comfortable status display: 12 LEDs
* Demodulator with A/D converter and switched capacitor filters
* Easy calibration by software support
* Lithium battery buffered realtime clock
* Automatic Logbook function, battery buffered
* Build in PMS system (personal mailbox), also battery buffered

The PACTOR mode has been developed by DF4KV and DL6MAA, the whole
PACTOR Group also includes DL3FCJ, DL2FAK, DLLZAM, DK5FIl and DF4WC.

Ordering-Conditions: A PTC can be delivered completely assembled or
as a kit including all parts.

PTC assembled and calibrated 390$
PTC kit including all parts 320$
Payments are due in advance.

For further information see the corresponding articles soon published
in several Amateur Radio magazines. If these publications do not
answer all questions feel free to write to the address below, SAE and
IRC (or 1$) should be included for convenient and delighting processing.

>transmitter, but the antenna would not be resonant. The common dipole,
>for example is not a perfect match for 50 ohm coax. If you prune a
>dipole to exactly a 1:1 VSWR, it will be slightly off the resonant
>frequency.

Nope. Z = sqrt(X^2 + R^2). For this example, Z = 35.4 ohms. Thus,
SWR = 50/35.4 = 1.41 (about).

It is true that a "resonant" dipole is actually not what gives us
a resistive load at the end of the transmission line. A truly "resonant"
dipole is, I think, slightly capacitive due to it's inductive coupling to free
space (or something like that). So we cut our antennas short to be have a
reactive component of the opposite sign so as to cancel out the reactive part
of a "naturally resonant" dipole. However, such an antenna will show only a
resistive impedance and an SWR of 1:1. If we didn't cut our antennas so
as to cancel out the reactive coupling to free space, we'd see an SWR
greater than 1:1.

I may have my signs wrong, but the argument remains essentially the
same...

73 & happy GDOing!

1536. re: Model 500 battery packs

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-02 16:09:39 UTC
From: rlreed@wsuiar.wsu.ukans.edu
Message-ID: <1991Aug2.100939.257@wsuiar.wsu.ukans.edu>
Source record: 294816

I like an easy question, the model 500 battery. Take a voltmeter and read the voltage of the battery (if you want to) and then go to down to your nearby Radio Shack and get you a replacement. The other option is to take the pack apart and replace the individual cells.

1537. "Standard" 12V Power Connector?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-02 16:14:34 UTC
From: faunt@cisco.COM
Message-ID: <9108021614.AA09105@dirt.cisco.com>
Source record: 294823

The information floating around that the ARRL approved the PowerPole is bogus according to the minutes referenced. The minutes say the selection was passed on for technical evaluation.

My feelings are the the PowerPole is pretty readily available, that the selected connector is a least common denominator choice, and is adequate, and a slightly better selection is the heavier duty version of the same connector, available from Molex, and the ubiquitous Radio Shack. I use the PowerPole, the "standard" and the heavier duty one in approriate places. I have a couple of adapters handy, including the one to match our less-enlightened brethern and sistern in SVECS who adopted the same connector as the "standard", but with reversed polarity. Alameda and Contra Costa (California) counties have an "Instant Trainer" pamphlet for emergencies, and it suggests the standard, and the heavier one be available. No-one in these organizations that I have talked to know anything about the PowerPole, either.

>

Well, I'll have to agree that it's not Mil-Spec, but who can argue with
success? One can argue specs and numbers, but many times I adopt the
try it and see approach. For example:

We ran our Ten-Tec Corsair 100W HF rig for the entire field day contest
through one of the -222 plugs. According to the 8A rating, the plug
was overloaded. On the other hand, the plug is rated for 25V/8A which
does not necessarily mean that the rating is the same at 13.6V. If you
measure the plug by wattage, it's a 200 Watt plug. At 13.6 volts, 200
watts means 14.7 Amps!

I can also say with certainty that wires larger than #18 will work. I've
used #14 wires with no problem. One thing which I insist on for the -222
plug (and all crimp-ons) is that the crimp connection is good for just
one thing: To hold the pins on the wire while you're soldering them.
I _always_ solder the -222 connector pins. To date I've not had a single
failure of any kind using this plug.

Yes, we did have some voltage drop at the Corsair using this plug, but
I didn't lose any sleep over it. The drop was about 1 volt as I
recall. Did this impair our communications effectiveness? Not that I
could tell, but I'm sure that our output power was reduced a little.
Nevertheless, we still indicated about 100 on the output meter. And
the receiver worked just fine (:-).

As far as the pins being thin and un-fixable when they wear out, well,
and 99 cents I'm not going to sweat that either. I've usually got
a few sets of them in my toolbox anyway.

The -222 is a good, inexpensive, medium duty, general purpose connector.
For a lot more money and trouble, you can get a much better connector.
Try finding a PowerPole, for example, in your typical small town on
a Saturday morning. Good luck!

What this country needs is a good 5 cent cigar, and a good 1 dollar connector. I'm convinced that this (RS 275-222) is it.

Al, I actually believe that the state RACES folks(read Stan Harder, et al)
have endorsed this particular connector. I believe this is the same
connector used on several state vehicles so its sort of a natural
attitude for them to assume. The problems you mentioned with the
connector are its' real Achilles heal, i.e. you can't find that
particular connector anyplace convieniently.

>"As a result of a study commissioned by the League's Volunteer
>Resources Committee last year, the Field Services department is
>recommending the MOLEX Series 1545 connector for use in
>promoting compatibility and interchangeability among personal
>VHF/UHF radio equipment at disaster and public event sites.
>Polarity should always be verified prior to connecting radios
>and power supplies."

I know that several people have been pushing Newington to make
some choice....and they finally did do what we've been asking!
Now the trick is to get everyone to pick up on the standard and
move to it. In Santa Clara Valley Section a fair number of
people have adopted what is locally known as the SVECS standard
connector. The good news is it's the same connector, the bad
news is the polarity is reversed from our standard ;-) Even
with a previously existing standard the Santa Clara County
Emergency Coordinator's council recently adopted the league
standard, further they set a local deadline for everyone to
have changed over to the new standard.(Coincides with our
next major drill) Point is that this will only be as
successful as the field people make it! I've been using this
particular connector in daily service for 5-6 years and never
had a failure of any sort....I urge EVERYONE to look into
changing over to this standard! I know that the SCV Section
Manager is really pushing this...and I agree with him ;-)

> stuff deleted...
>AL N1AL

P.S. As a side note for anyone that is in doubt to the utility
of having such a standard let me assure you that it made
life ALOT easier during the 89 Quake. All of our EOC's
and control points in the area were fitted with our local

standard and allowed us to populate the sites with just about anyone's radio gear as required. Now when we go out of the section to help out we're likely to have the same benefit!

1540. Major Solar Flare Alert - X-Class Event - 02 August

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-02 16:29:41 UTC
From: oler@vp.uleth.CA
Message-ID: <0094C83C.4C396580.3335@hg.uleth.ca>
Source record: 294824

-- MAJOR SOLAR FLARE ALERT --

AUGUST 02, 1991

Flare Event Summary
- Low Impact Possible -

MAJOR ENERGETIC EVENT SUMMARY

A powerful solar flare erupted from Region 6757 at 03:18 UT on 02 August. This flare, rated a class X1.5/2B, began at 03:06 UT, peaked at 03:18 UT and ended at 03:39 UT on 02 August. The flare was associated with a strong Type IV sweep which lasted 11 minutes (importance 3), and a tenflare which lasted 17 minutes. A moderate to strong SWF was also observed over sunlit sectors, but was not particularly long in duration.

Earlier today, a respectable class M4.0/2B tenflare erupted from Region 6749 at 15:21 UT on 02 August. Located at S16W10, this flare was associated with parallel ribbons and a 300 sfu tenflare.

Region 6757 has exhibited remarkable growth over the last several days. It is now a healthy size with an impressive EKI optical configuration and a beta-gamma-delta magnetic configuration. This group is continuing to grow at a respectable rate and will cross the central solar meridian within the next 24 to 36 hours.

Region 6749 is smaller than Region 6757, but is still capable of producing M-class flares.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

This last major X-class flare could have a low to possibly moderate terrestrial impact. We expect flare effects to be similar to what we are presently experiencing (generally active conditions over the middle and low latitudes, with minor storming over the high latitudes). Any disturbances produced by this flare should not be observed until 04 August. A high-resolution GIF image of the x-ray plot for this flare will become available on the STD BBS later this UT day.

Region 6757 will continue to produce occassional M-class flares and certainly has the potential to produce another isolated major flare. Another X-class event is quite possible. This region is now well placed for producing terrestrial impacts.

** End of Alert **

1541. Re: Source for telegraph key

Newsgroup: rec.radio.amateur.misc

Let's get some general dates set first regarding telegraph:

Morse is at work on his telegraph in the early 1840's.
The bug is not invented (or should I say patented) until 1905
although there are some claims of some "bugs" earlier than that.

Horace Martin was the pantentee for Vibroplex with his "Autoplex"
model. Vibroplex was by far the manufacturer of the greatest number
of bugs. They are still made.

THere are many hams using bugs but electronic keyers are far more
popular. Bugs give your sending a personality - keyers make everyone
sound the same.

---------- Original Article ----------
>Let's hope that our alien is at least tuned to PBS and not to
>I Love Lucy reruns...

Funny you should mention that. I once wrote an SF story about a race of aliens who communicated with each other by natural radio, the way we use sound; they could "speak" and "hear" in radio frequencies. When our TV signals started reaching them, they couldn't shut them out, and it was driving them nuts. They mounted an attack fleet, came to Earth, and zapped everyone named Lucy...

Cheers... Mike White, N4PDY m14494@mwvm.mitre.org

The Anderson Power-Pole connectors are available from Allied Electronics, which has offices in many communities throughout the USA, has an export division for foreign orders, accepts mail, phone, and FAX orders, and takes credit cards in payment. I believe their minimum order is about $25, which is only a couple of connectors.

I have to disagree with you on wanting to use a molex connector.
First let me say that there is nothing wrong with molex products but
when it comes to high current applications the molex connectors overheat
and become resistive.
I have had experence with continious high current applications using molex
connectors and after time they did break down.
My experence with Andersom Power pole products and been good. I like the
fact that they don't make first contact on the working surface and are designed
for high power applications. If you ever noticed that molex conectors are
great for small signal work but industry has chosen Anderson Power products
for high current applications, ie fork lift batteries..etc.

The Anderson Power Poles might be a little harder to find but, I do think they
are worth it.

The local Ham/Calif. Div. Of Forestry (VIP) group has standardized on the
15/30 amp Anderson Power Poles (same physical size). The district CDF public
information officer has extra power connectors in his rig so when we "roll"
we just have to plug in and go... He also has covered his dash in velcro
to quickly attach radios to. He has earned the nick name Captain Velcro.

I think the best thing you could do is make sure that everyone that you might
be involved with in an emergency has the same connector. It is also good to
make up a few adaptors that you could use to convert to another system in the
event that you find yourself in with a group that uses a different standard.

Keep in mind that these are my opinions based on my experences with various
types of connectors within the electronic industry. I do not represent the interests of
Anderson power products, molex, or my employer, Hewlett-Packard.

I am involved with RACES/ARES here in Sacramento, and when I started, they handed me a sheet that described their standard 12V connector and how to wire it up. They had selected the 30Amp version of the Anderson power pole connector and included a list of places that supplied it. I have also seen Power Poles sold in hobby stores for use in electric Radio Controlled cars and planes. For some reason, they are sold under a different name, which I can't remember. ARES/RACES also had a standard packet connector which is different from the standard proposed in 73 magazine. The nice thing about standards is that there are so many to choose from :-) .

What most people in our club did was make several adapters from the Molex (our informal standard) to the Power Poles. The molex connectors are also good (except for the current rating) as they are cheap and available at radio shack and most people seem to wire them up the same way (pointed end = +12 and power source connector with female contacts in the male plug).

In general, with ARES/RACES, as with field day, it pays to bring any and all adapters you can get your hands on because you never know what you will have to patch together.

daveh@compnect.UUCP (Dave Hultberg) writes:

>IF R=50 ohms, then a VSWR=1:1 would indicate resonance. BUT, what if
>X=25 ohms and R=25 ohms. You would still have a 1:1 VSWR as seen by the
>transmitter, but the antenna would not be resonant.

Not entirely true. The |Z| = SQR(R^2 + X^2). The Z in this case is 35.35ohms
or a VSWR of 1.414:1 at a Phase Angle of 45 Degrees.

Yes you could indicate a 50 Ohm Z but not necessarily resistive, and by no
means does this indicate resonance! The dipole should be cut to resonance
and then "Matched" for 50 ohms resistive. One could have a 70 ohm Dipole
matched (Reactance tuned out) for 70 ohms and still have a 1.2:1 VSWR if the
Line and source is 50ohms. And be careful at VHF and higher with simple or
homebrew VSWR Bridges...if not designed properly these could introduce a
reactive component on the line giving you incorrect readings!

I am in the planning stages of determining what it will take to
get a simple CW station on the air with a migration path as my operating
privileges grow. To this end I will be putting up a 40-20-15-10m trap
dipole with an older 100-150 W rig to operate on these bands.

I have 2 concerns.

1) which is the best direction to orient the dipole to
obtain the greatest coverage??

2) Since the feedline is unbalanced and the dipole is
balanced I wish to use a balun to keep feedline emissions
to a minimum. In their book "Simple, low-cost Wire Antennas",
William Orr W6SAI and Stuart Cowan W2LX describe a trifilar
wound balun on a core of ferrite rod. In a brochure,
Bencher claims there is no ferrite core to saturate or
re-radiate. They also claim that ferrite cores are lossy
and saturate at higher frequencies.

While it has been my experience (from building magnetic
test equipment at a past employer) that core loss is
proportional to frequency, because of this fact, it
becomes difficult to saturate if not impossible unless
you dump in considerably more power to overcome the core loss.

Who is right? Can anyone recommend a balun design with easy to
get components which will work in the proposed setup??

regards,

>This may be true, but it is an insulting and demeaming comment on hams to
>insinuate that they cannot obtain any piece of hardware not advertised in
>QST or the AEA and HRO catalogs.

When I was originally investigating this several months ago, I looked long and hard for a source of these connectors. In addition to two local and two mail order retail electronics outlets, I called two local wholesale distributors as well as a couple more down in Marin County. None of them stocked the Anderson connectors.

>8 amps is distinctly marginal for any radio. My IC-47/A is rated at 7 amps,
>my Kenwood TM-731A at 11 amps, the FT-4700 is 10 amps.

8 Amps is over 100 watts from a car battery. And note that 8 Amps is the manufacturer's continuous rating spec. I'm sure it can take more in intermittent-duty service. Also, presumably the 8A number includes some design margin. I think a "10" or "11" Amp radio (that probably typically draws 8 Amps or so in transmit and 1-2 Amps receive) would work just fine with the Molex connector.

>Forget powering an HF rig.

The application was for VHF/UHF radios that would be taken to an emergency incident. HF radios are a different case.

The Anderson connectors have supposedly been a "standard" for a number of years now, yet few hams are using them. Another problem with these connectors is that they are "sexless" and the + and - connectors are held together only by a sliding contact -- It is easy to plug them in backwards. Also there is potential confusion on the wiring convention: How do you wire up an AC-operated power supply? If you wire it like a battery, it will work OK to power a radio, but if you plug it into a battery to try to charge it, sparks will fly! (With the Molex connector, it simply wouldn't fit.)

Bottom line -- I was originally all excited about standardizing on the Anderson connector until I started looking into it. I think the Molex connector is the way to go.

At 13.6 volts, 200 watts means 14.7 Amps!

But connectors aren't rated in watts. The carrying capacity of a wire, and the heating of a connector is I^2R. That means that for a given connector (R) the only thing that matters is current (I). The voltage rating is usually for arcing and breakdown purposes.

Before sending anything out there into the depths of space, please make sure you send "QRL?" first (that's "QRZ the frequency!!!" for you phone types), and listen carefully (for a few centuries) for a reply. You don't want to QRM a QSO in progress, them extraterrestrials can get mighty mean if y'all try to take over their frequency. Course, if someone replies "whaddya want good buddy, come on back!" you may wish to reconsider the whole thing.

So you think that the new crop of handheld transceivers from the Big 3 have a lot of bells and whistles? Hardly. In fact, they've barely scratched the surface. This new radio completely redefines the term "state-of-the-art" when it comes to amateur radio.

The AHT-2000 covers the 2 Meter, 220MHz (1.25 Meters), and 440MHz (70cm) bands. It's apparent that the manufacturers are now about to do an about face with their commitment to 220MHz in light of the recent surge in amateur radio activity and further crowding of the bands. After all the 220MHz band, even after having been shortened by recent FCC rulings, is still just as large (4 MHz), and just as usable as the ever popular 2 Meter band.

The tri-band design of the AHT-2000 incorporates 4 microprocessors, one for each band and one "master" CPU which serves an the central control unit. Each band CPU can run a completely different "program" or it may be independently switched on or off as desired, enabling or disabling simultaneous multi-band receive. The separate control CPU allows you to continue accessing functions, even when you're talking (thanks also to the built-in VOX circuit)!

In the past couple of years the number of so called "bells and whistles" that have become standard fair on handheld transceivers has steadily risen to the point at which one can hardly imagine what might come next. Yet, from within the bowels a distant and secretive engineering laboratory has come a radio which at under $900 (list) represents a value that thousands of amateurs can hardly resist.

GENERAL DESCRIPTION

The engineers who designed this radio have thought of everything that the sophisticated user does need, might need, and will need for the next 10 years. In fact, with it's modular design and removable CPU/Memory control

modules, your next handheld may be just a board upgrade. Virtually every major subunit is a plug in module, constructed of mostly surface mounted LSI components. In fact, there's even a specification for the internal backplane, which the engineers are calling the T-Bus.

The description begins with the overall size and shape. To begin with, this is not a "micro" HT in that it compares in size to the IC-32AT, although a bit thinner front to back. It's larger size gives plenty of room for the multi-function 40 key keyboard. Yes, finally there's a truly functional keyboard with legible keycaps and keys which fit nicely - ONE to a fingertip. Most of the keys have three functions and the keycap and background lettering is color coded to represent their 1st and 2nd alternate functions. Two keys serve as function prefix keys and they are color coded to match the corresponding legends on the general purpose keys. The primary key legends are molded into the rubber material to insure that a few thousand presses won't make them illegible.

The display is notably larger than those found on previous radios, even some mobile rigs. It has a large number of special purpose symbols as well as a 6 line by 16 character Alphanumeric display which doubles as a graphics display for certain functions. There's also a last keystroke recall function that lets you scroll through the last 100 keystrokes that you've made. These recalled keystrokes can be saved as a "program" or script for certain applications.

The radio has all of the de facto standard features found in rigs built up to this time. These features, which other manufacturers brag about in glossy brochures, are simply "oh, by the way" included in the AHT-2000. These include: automatic offset selection, CTCSS encode/decode, DTMF Paging, DTMF autodialer, multi-mode scanning and wide band receive, arbitrary TX offset selection (even cross-band), DTMF Memory Autodialer, time of day clock, automatic power off, and automatic frequency centering during scan.

SPECIAL FEATURES

Sounds pretty complete, doesn't it? Well, look at these additional features and you'll quickly see why those mentioned above merely fall into the "basic" category:

9600 Baud Digital Interface Unit (DIU) - this module is used in so many ways that it might be erroneously referred to as the heart of the radio. It is packet radio compatible and a 3 wire serial interface connector is provided on the side of the unit to interface to terminals

and other computers. More about this as we move on...

The radio is fully programmable over the air via DTMF codes. The codes are displayed on the screen as they are received. As an aside, this feature allows one to monitor DTMF code sequences from any source. This information is also very useful for remote program debugging - an important feature. All remote control capabilities are password protected, making sure that only YOU can access the radio. This is accomplished using a challenge-authenticate exchange scheme which changes each time it's accessed. The authentication codes are prearranged by the user using a personal computer program. Should the challenge-authenticate procedure not be used, a simpler (and decidedly less secure) "always-the-same" password can also be used.

By far the slickest remote control method is when to AHT-2000's are set to recognize only each other. In this mode, the DIU is used for high speed over-the-air remote control and data transfer between units. This mode requires no password entry (however you may lock the controlling unit's keyboard) since the two units recognize with each other. "Marrying" the two units is performed by interconnecting them by hard wire using their respective DIU interface jacks. A couple of keystrokes and they instantly learn each other's ID and authentication sequences. Each transmission between the two units under uses a unique computer generated authentication preamble.

Once two units are "married", you may directly control the remote unit using the local keyboard. A simple keypress switches you between the local unit and the remote unit. Communication between the units may take place on any of the 3 available bands, and should contact be lost on one band due to signal fading or other reasons, the control channel can quickly be switched to another band. The functions which are remote controllable via another AHT-2000 include virtually the complete set offered by the radio. You cannot, however, control one AHT-2000 which in turn is used to control another AHT-2000. Only one control loop may be realized.

The control channel may also be the voice channel - at the same time. Control data is interleaved between voice transmissions in short bursts. If you change the frequency of the control channel, both frequencies change on both transceivers. An automatic voice ID may also be sent before the QSY (frequency change).

These DIU modems also implement a form of DCS (Digital Coded Squelch) which operates much in the same manner as

the popular DTMF paging functions found on other rigs. One of the nice features of this DCS implementation is that you need not assign arbitrary "codes" to each user station. You simply call them by call sign, which is keyed in using the alphanumeric function keys. Any two AHT-2000's may signal each other using this interface. The AHT-2000 also operates with standard DTMF paging/coded squelch making it compatible with other popular transceivers.

The digital paging function also includes incoming messages from packet radio. You may receive a page complete with message text. You may program the unit to automatically issue a reply indicating that the message was received. An outgoing message may also be programmed for packet transmission, but it's length is limited to the size of a single display screen. When used with a remote terminal or personal computer, the packet modem functions as a conventional TNC without restriction. It has been suggested that a frequency agile BBS could be constructed using this interface.

(end of part 1)

1556. The AHT-2000 Handheld Transceiver (Part 2/2)

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-02 20:10:37 UTC
From: flloyd@L1-A.West.Sun.COM
Message-ID: <1931@west.West.Sun.COM>
Source record: 294822

INTRODUCING THE AHT-2000 HANDHELD TRI-BAND TRANSCEIVER (Part 2 of 2)

by Fred Lloyd, AA7BQ

(Note: This is the second part of a 2 part article.)

SPECIAL FEATURES (cont'd)

Voice Synthesizer - This ability permits fully functional remote base operation from any DTMF capable handheld. With the voice synthesizer, users have complete control loop feedback when accessing functions. This permits querying the radio as to it's current state, frequency, and other settings and receiving a voice response. This is especially handy when remotely tuning a VFO. As an added bonus, you can mute the voice feedback to keep your QSY semi-private. Of course, if you're using another AHT-2000 to do the remote controlling then you don't need the audio feedback, since you you can see the display of the remote rig it on your own screen.

While DVR's (Digital Voice Recorders) have been available for some time now - albeit not on handhelds, this one *is* different. For instance, when used in conjunction with the onboard automatic timer, you may have a natural voice ID'er. It also does the radiotelephone equivalent of "last number redial" in that at the press of a button it will repeat the last voice message sent (up to 2 minutes). You can also enable the endless loop recorder which remembers everything heard for the last 2 minutes. This may be retransmitted if desired, and is capable of implementing a simplex repeater. It also functions as a store and forward voice mailbox. And, like almost everything else, is remote controllable.

Half Repeater - Any one AHT-2000 comprises one half of a full duplex repeater. Connect two radios together for full repeater functionality. All of the major functions are available, adjustable timeout, automatic ID'er (voice or CW), DTMF control functions, most of the standard repeater controller attributes.

General Purpose Memory - or GPM for short. There are no preset number of channels available, however if pressed you could probably store somewhere around 1000 operating frequencies. Instead, the system has a fixed amount of RAM

which is slowly consumed as you memorize frequencies, DTMF codes (telephone numbers), command sequences and the like. A two key sequence will instantly tell you how much GPM is left. For the computer types out there, the unit comes standard with 128K bytes of GPM. This may be expanded (at the present time) up to 256K bytes.

A percentage readout Battery Time Remaining indicator - isn't it about time? Now you can accurately estimate when your battery is getting low and you can be sure and take the spare (which comes with the unit) along with you. Couple this with the 1000mAh Batteries and you've got about 16 hours of typical on the air rag chew time or about 28 hours of "other" operating modes (described below).

The unit is also equipped with an ACTCSS (Automatic CTCSS) feature - This implements the usual form of "PL" tone encoding but with a twist: When receiving a signal which is being transmitted along with CTCSS, the CTCSS tone frequency is displayed and the unit set's a temporary memory location with the value, in case you then wish to use it - for transmit or receive.

Now here's one that you probably didn't expect - a built-in frequency counter. This dynamite feature, which may occupy any unused band receiver, may be used to do frequency hunting. You can, for example, detect nearby transmissions on any frequency by direct readout. Press one button and the received frequency is programmed into a VFO. For more traditional uses, it's great just to have around the workbench. In a more general case, suppose that you are riding in your car and see someone talking on a microphone. No problem figuring out where they are, what PL they're using and if it's appropriate for you to join in.

To sweeten the pie just a bit more, there's also a built-in digital RF field strength meter, which is calibrated in tenths of microvolts at the antenna connector. This may also be accessed via remote control and reads out in microvolts or percent quieting. It makes a dandy receiver for t-hunting. There is also a calibrated output power meter, and a digital SWR indicator. If, for example, you were stuck without an antenna, you could trim any odd piece of random wire to a 1:1 SWR.

As if it weren't enough, there is also has a built-in deviation meter. This works both on transmit as well as receive and can be used to calibrate or just monitor other signals as well as your own. Other "test equipment" features include a low power signal generator (10mW maximum output) with calibrated output in tenths of microvolts.

You can perform most of the alignment a receiver with this radio.

There is rumor of a spectrum analyzer module (probably a ROM) which may be available by the fall. Judging from the RF capabilities that it already has, it would seem like software, and possibly some sort of DSP chip might make this a straightforward add-on.

The RF section contains an adjustable selectivity receiver front-end for each band in which center frequency and bandwidth may be set to user preference. This goes a long way towards eliminating the intermod problems of earlier designs.

Another first are the optional, clip-on 5, 10, and 20 Watt power amplifier modules. These modules match the case exactly and each one adds from one to two inches to the length of the radio. The 20 Watt module has an extra power supply connector. Presumably these modules come in handy when the remote base and repeater modes are used. When attached, the modules may be switched on and off under program (remote) control to conserve power.

There are several external connections available for user expansion. These include a discriminator output, an audio input, a direct FM modulation input, a serial data interface for the DIU, AGC level output and PTT. A single MIL-STD type 7 pin connector is used which has a metal shielded hood. The connector plug and cable come with the radio! The unused ends of the wires are labeled appropriately and the user manual shows a number of suggested hookups.

The user manual is wonderfully illustrated and there is a comprehensive index listing all the possible modes. It appears that as much time was spent in preparing the manual as was in designing the hardware and software. There is an example illustration for nearly every function and each task is gone through in a step by step manner. It is also apparent that the manual is not a direct translation of some other language and that the writer(s) were perfectly fluent in the language used (there are apparently several different language versions of the manual).

Unlike many other radios of our time, there appears to be no "secret" or undocumented features which inevitably end up in some "mods" database somewhere. Everything is right up front, in plain view and open for discussion.

PROS/CONS AND OTHER CLOSING THOUGHTS

PROS

This design completely outclasses all of the competition in the handheld transceiver market. It breaks into the packet radio field, the repeater field, the test equipment field and the remote control field all at once. It offers an extraordinary number of features and capabilities in a single comprehensive instrument. It's modular design allows for quick repair, easy upgrade and sets a new standard for handheld communications tools.

CONS

No company, firm, organization or individual has announced any plans for building or developing the AHT-2000. This exciting transceiver exists only in the mind of the author. This entire article has been an exercise in technical imagination which sought to explore realizable possibilities in amateur radio. In this article I have chosen to limit my imagination to what is possible given a reasonable application of current state-of-the-art technology.

Let's hope that these words might inspire the designers and manufacturers to broaden their horizons and explore just what can be done using today's modern technology. After all, I'm ready to buy one, no, make that TWO, right now!

1557. Standard Radio Dealers?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-02 20:25:55 UTC
From: stigall@bronze.ucs.indiana.edu
Message-ID: <1991Aug2.202555.9417@bronze.ucs.indiana.edu>

Anybody know where to get accessories for Standard radios, in particular the C-500, which was sold by Heath as the HW24HT? I'd like to get a speaker mike, and have one "on order" from a less than enthusiastic person at Universal Radio (in Ohio). What I'm looking for is a dealer with the full line of Standard stuff that really wants to sell them.

Thanks,

I tried buying about $300 worth of coax and connectors with my VISA and they wanted to add a 5% surcharge because of the card. I politely declined and bought elsewhere. I don't expect I'll try them again.

Not if you will please take your retentive fears about Radium Shack
2 meter rigs to rec.radio.policy or somewhere else. I have suffered
the code wars of 87', more code wars, no-code wars, sky-is-falling
predictions about the Radium Shack 10 meter rig, and now this 2 meter
thing. When I picture herds of antenna-beanied hams running into
their local RS whining, "Oh please don't sell these radios to the
oakies from Muskogees", I have to ask myself, do I belong to this
group?
So, now that I have your attention, either start thinking positive,
take it to .policy where I can't read it, or suffer the reincarnation
of some of your favorite kill file nominees.

Several years ago, I also adopted this connector independently for my homebrew QRP rigs and other miscellaneous 12V gear, after some bad experiences with phono plugs. A friend jokingly referred to it as the "KB1RT standard power connector". Like SVECS, my only deviation from the standard as described was that I got the polarity reversed, but that's easily fixed. I urge you to adopt it so I can plug my gear into your power supplies :-).

That radio was undoubtedly a "demo" unit. Regarding TT policy: I tried ordering about $300 worth of coax cable and connectors with my VISA card. They were going to add a 5% surcharge to the price and so I declined and purchased elsewhere. The salesdork was rather brusque and on the verge of actually being rude. I don't believe I'll try ordering from them again. There are too many other -good- places like HRO.

1562. Re: "Standard" 12V Power Connector?

The Molex 1545/Radio Shack#274-222 has long been the connector for use within our ARES group in Williamson County (TX). The RS part includes one male and one female in the package. Our "hot" end (for battery/power supply connection) is wired to alligator clamps since we've found many city/county vehicles that don't have lighters. (Most of us also carry the cig. lighter "hot" ends as well; wishfull thinking mostly :-)

Interestingly, my HW-9 from Heathkit came with these connectors, but the instructions would have resulted in them being wired backwards (relative to + and relative to "hot" end). I wired it to match the ARRL description as Al posted. Since there are three hams around our house, we have a _lot_ of these connectors wired up!

Source record: 294736

I think there is some confusion as to the Volt and Amp rating
of a connector and I would like to provide some clarification.

Both numbers are significant and neither one can be combined with
the other to produce a "certain wattage" connector.

The voltage rating refers to dielectric properties between ajacent
pins in the same connector. In other words, what voltage potential
can exist between ajacent contacts without dielectric breakdown and
arc-over. Since you are running 12V in a 25v contact rated connector
there should be no problem. The current rating is the one of greatest
concern and is a function of the pin material and its plating.

What happens above the current rating of the pin is that it becomes
significantly resistive so as to drop supply voltage across its connection.
When this happens, the contact looks to the supply like a resistor in
series with the equivalent series resistance of the radio. In effect,
a simple series voltage divider. The amount of voltage delivered
to the radio is the supply voltage minus the voltage dropped across
the connector. This can be verified with a simple volt meter. Measure
across the CONNECTOR then measure across the RADIO. If the current
being drawn by the RADIO is greater than the contact rating of the
connector a voltage drop will appear across the connector (simple
series resistance circuit; current is constant through the circuit)
with the remainder delivered to the radio.

I used to design high-voltage, high-current capacitor discharge
electronics, and even though 'a wire is a wire', ESR (equiv. series
resistance) is very real when high currents are involved. Since
I have no experience with radios and how much current is drawn for
a given wattage output this may not apply, but the physics is here
anyway for those who care to know.

1564. Minor Geomagnetic Storm Alert - 02 August

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-02 21:25:00 UTC
From: oler@vp.uleth.CA
Message-ID: <0094C865.8D2F0C60.3686@hg.uleth.ca>
Source record: 294737

/\

GEOMAGNETIC STORM ALERT

ISSUED: 09:00 UT, 02 AUGUST

/\

ATTENTION:

A minor geomagnetic storm storm began near 06:00 UT on 02 August. The cause of this disturbance is believed to be the class X2.3/2B flare of 31 July. Coronal effects may also be enhancing activity somewhat.

No significant storming has been reported. Activity is expected to remain confined to the minor storm levels. Periods of major storming may occur over some high latitude regions.

Conditions should remain generally active to minor storm through to 05 August. An impact from the major class X1.5/2B flare of 02 August should arrive on 04 August and keep activity enhanced through 05 August. On 06 or 07 August, a well placed coronal hole should bring activity back up to at least active levels. Therefore, conditions are not expected to become particularly quiet again until after approximately 10 August.

Auroral activity will remain moderate over the high latitude regions for the next 24 hours. The extent of the visible activity will be limited to the high latitude and northerly middle latitude regions. Although lunar phase will continue to interfere, a window is beginning to open for better viewing conditions. Lunar phase will continue to interfere less over the next week.

HF propagation conditions have become degraded over most latitudes. High latitude regions and signals on polar or high latitude paths are suffering the worst conditions. MUFs likely will not recover to the levels observed prior to this disturbance. Occassional SWFs will be observed over the next 48 to 72 hours due to minor and possibly major solar flaring.

VHF conditions have remained near normal over the middle and high latitude regions. No reports of scatter communication have been received. Please report any observations of VHF scatter communication (or any unusual DX) to: Oler@Hg.Uleth.CA, or to: COler@Solar.Stanford.Edu.

** End of Alert **

More Confessions of a Hamfest Junkie

By Fred Lloyd, AA7BQ

Despite what my earlier article may have indicated, I've still got much to learn regarding the business buying and selling quality, pre-owned marine accessories (i.e. boat anchors). I've just returned from the Southwest's "big" event of the year, the Ft. Tuthill hamfest in Flagstaff Arizona. Here's some random thoughts and observations:

UHF Micors - As common as PL-259's, and about as cheap. Typically in the $50 range. The VHF models, however, were still up in the $150 range. The only reason that I can guess is the lack of VHF Micor availability.

800 MHz Business Band "Trunking" radios. Still expensive - Why? I've never seen anyone buy one of these, although some rumors suggest that ham application at 900 Mhz might be possible.

The grand old Tektronix scopes, the big dual timebase models like the 545 and such, have now hit scrap metal prices. Last year they would bring anywhere from $50 to $150 dollars, but have now sunk to the proverbial seabed price of 20 bucks, and don't dare ask for any help in carrying it out to the car. I helped a friend unload, er, Sell an old rackmount single timebase model for $15, with a set of 4 different plugins. And the thing still worked! Oddly however, people will still pay $30 for the cart!

What's the difference between your typical non-ham flea market and a hamfest? People at hamfests have _money_ to spend.

The TS-940 is now probably the worlds best buy on the used HF market. Current prices are now in the $1100 - $1250 range.

The hamfest starts when the sellers begin to arrive - even the day before. The Ft. Tuthill meet (a three-day camp-out affair) officially ran from Friday thru Sunday. Many deals went down on Thursday afternoon (so I'm told) and by Sunday there was nothing left but scorched ether.

I had a rather large, tall box of misc radio parts, relays, motors, fans and such, on which was labeled "$1 Grab Box".

No takers, not even any lookers. When I changed the sign to "$1 a handful", people started rummaging through it. I netted a total of $4 from the whole affair. Next, I put a "FREE" sign on it. The next thing I saw were 4 people's rear-ends sticking up in the air as a free-for-all junque dive ensued. In about 10 minutes even the cardboard box was gone...

There was a even Macintosh with an extra external disk drive for $200...

A complete late model Collins S-Line station with the 30L-1 and station monitor console sold for $1100.

I bought a 6 channel Tempo 2 Meter handheld, working and complete with useful crystals, 8 good AA Nicads and a drop in charger for $12.

During the course of a hamfest day, large items will sell first, followed by the smaller accessories and parts. If you are selling a lot of large items, be sure and start early. If you've got a lot of small (<$100) items, you can expect to start selling a little later in the day, after the big deals have gone down.

Fastest selling item at the hamfest - Any Kenwood TS-440 less than $900. Slowest selling item - multiple tie involving several heavyweight contenders - some now under consideration for artificial reef duty.

Fastest selling handhelds at the commercial booth (HRO): Icom 24AT and Icom W2A. Complete sellout of dealer stock on both models. Noted that the 24AT's were the first to go.

First new-generation HF rig to pass quietly into obscurity: the TS-950. Sales have virtually evaporated since the introduction of the TS-850. The 850 is now the undisputed volume leader in new HF rig sales. This was brought about by the disappearance of the TS-440 from dealer shelves, in anticipation of the TS-450. The TS-440 remains the all-time best seller.

Well, so much for the high points :-)

73,

I can understand your concern, but I sincerely believe it to be incorrect.
The USA is one of the LAST countries in the IARU to foster a code-free
license, and if other countries are anything to go by, the amateur radio
community will not suffer adversely from this new class.

Specifically, the United Kingdom introduced a code-free license back in the
early seventies, and has not suffered unduly from unscrupulous sales people.
It has become the norm for someone to start out with the code-free license,

and then quite quickly upgrade to the full license. In my case, the reason I chose to upgrade was simply to be able to use code. When I held my class B license, I was not allowed to use CW on the air without upgrading. This is no longer the case, however. I have very little interest in HF operating - my bag is weak-signal VHF & UHF work, where CW is frequently the only way to make a contact. For those whose mouths have just fallen to the floor - yes, the VHF bands do provide more challenging opportunities than seeing how many repeaters you can hit with a negative-gain antenna on a hand-held in the basement :-) I have nothing against repeaters and FM - just the people who have the attitude that that is all two metres is good for; like the local extra-class club member who initially asked why we'd need to put up a VHF beam for field-day, when all we would work was the local repeater during the event; subsequently fell into hysterics when he noticed that we were using a key on two; and then quickly disappeared when he heard us working th East Coast...

Summarising, the American amateur community will ONLY benefit from the introduction of a code-free license class. IMHO, it is a great shame that we, as a community, didn't realise this, and introduce it years ago.

73 & look forward to hearing you on the really challenging bands :-) :-)

73's

1568. measuring SWR with low power output

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-03 00:28:18 UTC
From: alewis@gmuvax2.gmu.edu
Message-ID: <1991Aug3.002818.2581@gmuvax2.gmu.edu>
Source record: 294740
Cross-posted to: rec.radio.amateur.misc,sci.electronics

Hi,

I need to do some SWR measurments at low power. The frequency range is
2 MHz to 30 MHz, and the power must be less than 1.5 Watts. From the
catalogs that I have available, the only vendor I could find is Bird.
Their meter housing (4410A, 4411, or 4412) with a 4410-3 slug would
do the trick except they can't ship for three weeks. Of course, I need
to do these measurments right away. I have tried calling a few equipment
rental places but none have the proper slug. If you can suggest another
meter, another manufacturer, or point me to someone who can rent this Bird
meter to me, please send me email.

Thanks,

Alan (:^|

1569. small linear for QRP rig

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-03 00:53:00 UTC
From: self@bastille.ics.uci.edu
Message-ID: <2899FE6C.29340@ics.uci.edu>
Source record: 294739

I would like to build a small linear amplifier (30 Watt output) for use with my Ten Tec Argonaut QRP HF rig. The Argonaut puts out about 2 Watts which is often enough, but sometimes I have trouble getting through the QRM. Going from 2 Watts to 30 will give me an extra 2 S-units, and should bring me up to full copy. I would prefer a kit with available printed circuit boards, but just a schematic and parts list would be helpful.

Thanks,
John Self KC6VUG

1570. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-03 02:23:09 UTC
From: tkelso@blackbird.afit.af.mil
Message-ID: <9108030223.AA01296@blackbird.afit.af.mil>
Source record: 294770

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space and rec.radio.amateur.misc. This week's elements are provided below.

1571. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-03 02:24:12 UTC
From: tkelso@blackbird.afit.af.mil
Message-ID: <9108030224.AA01387@blackbird.afit.af.mil>
Source record: 294769

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space and rec.radio.amateur.misc on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a eleven-character name.

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 2
Column Description

```
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6

1574. Kenwood TS-450S

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-03 06:11:26 UTC
From: 1843eip@hickam-emh.af.mil
Message-ID: <9108030611.AA03754@ucsd.edu>
Source record: 294744

>I was informed today that although the TS-450 is in the country,
>the FCC has refused to type accept it. The problem is that it will
>transmit above 30 MHz. Rumor has it that the pressure is from
>Motorola who previously informed the FCC about some western city

I don't understand this. My TS-140 transmits above 30MHz and Kenwood's been
selling them for years now. What "type-acceptance" is involved here?

73,
Jeff Miller NH6ZW AFA8JM

1575. Just how far behind *is* the FCC?

Steve Sternitzke, NS5I, writes:

>Did you upgrade to Advanced from another license class and did you already have
>the FCC-printed license in your posession when you went to the upgrade session?

Yes and yes.

>If not, you probably had to send in a copy of your previous license before your
>Advanced ticket could be processed and this would add considerable delay time to
>your receipt of Advanced. In any case, your examining VE(deam has 10 days
>time to process the exam session paperwork and get it in the mail to W5YI-VEC.
>Then, the US Mail takes its own good time to deliver it to Dallas, TX. When
>W5YI-VEC receives it, we have 10 more days to process the session and mail the
>results to the FCC. (Again, any US Mail transit time is added.) The FCC has
>no set time limit to process your application (although 4 weeks is typical),
>then they US Mail it back to you. Total time: up to 20 days plus FCC delay
>time plus three US Mail delay times.

So worst case, we're looking at about 11-12 weeks...but I got a note from
another recent Advanced upgrade who got his ticket back in 5 weeks. He didn't
say which VEC, though.

Guess I'll just sit tight for another couple of weeks...

>Unfortunately, the FCC has a rule that disallows more than one license
>application per person from being in their "mill" at once. This means that the
>VECs (including W5YI) are required to handle the burden of keeping track of
>whether or not an applicant has something in the FCC works or not. If so, they
>are required to hold the application until EVERYTHING (including a photocopy of
>any current license) is all together, THEN AND ONLY THEN are they allowed to
>send in the next upgrade.

Then if I put in a address change and don't get the new ticket back before
taking a test, do you also hold the upgrade until the new ticket arrives, or
does their restriction apply only to upgrades?

>>(Side comment: if the FCC requires the VEC to hold an upgrade when an earlier
>>upgrade is still pending, then what's the point of the block on the 610 which
>>addresses that very issue?)

>These blocks are used by W5YI-VEC to let us know you have an upgrade pending.
>It's our method to help us keep track of applications which must be held for
>later processing. (Other VECs may work differently.) I think these blocks
>were holdovers from earlier 610s when the FCC did all the processing themselves.

{
I guess the moral of all this is not to bother taking another test until you

get yer ticket back from the last upgrade/modification...seems like we're
taking a few steps backwards here :-(.
{
The reason this bothers me, other than the one I originally wrote, is that
I'm anxious to put in my paperwork to become a VE...

>>So what's the deal at Gettysburg? Are they so swamped with Tech applications
>>that their prediction in the no-code docket about a slowdown in processing time
>>is coming true?
>>....

>You're right, the FCC is VERY busy with all the Codeless Tech applications.
>They have only two full-time persons and one part-time person to work on ALL
>amateur applications and the popularity of Codeless Tech has increased their
>workload considerably. Budget constraints being what they are, it isn't likely
>that there will be any additions to their department, so look for even longer
>delays in the future. (BTW, one of the things that can be done to help them out
>is to write on your 610 in LARGE BLOCK LETTERS in BLACK INK.)

The VE team was very specific about the black ink business...I had already
prepared my 610 in just that manner, but then I'm not known for my penmanship!

:-)

73,
Jeff Miller NH6ZW AFA8JM

(Further followups on this should probably go over to the policy group...)

My control head is mounted on the ashtray in my pathfinder. This is above the Am/FM radio, and almost at the top of the dash..

It is in direct sunlight, and seems to suffer no ill effects. The control head does seem sensitive to having the little shield wire connected correctly.

I got lazy on time after "hiding" the control head, and did not connect the shield back. (It has a signal ground inside the cable) Occasionally, but not allways, I would get a sound on my audio just like a helicopter. Reconnecting the ground seemed to make the problem go away.

Funny how that works! :)

What you can do is order a yeasu mic.. I have an HW24HT
and use a Yeasu MH-12 speaker mic. You can also order the generic
mics that some manufactures are selling, MFJ comes to mind..

Jeff Miller writes:
> I do not understand this.

Neither do I. I posted the explanation of the delay that was given to me by EEB who say they talk to Kenwood just about daily. I am aware that the TS-140 goes above 30 MHz and I guess that the FCC's policy on equipment have changed. By type accepted, I mean the approval that the FCC must give to electronic equipment that it does not generate interference. One day I had an FCC person from DC in my home. He crawled behind my equipment to look at the back of my B & K Precision 2520 o'scope. I asked him what he was doing and he said he was checking if it had been type accepted. Guess they get excited about such.

=========
SpaceNews
=========

MONDAY AUGUST 5, 1991

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* MIR NEWS *
============
Later this fall, an Austrian Cosmonaut will operate AREMIR (Austrian Amateur
Radio Experiment Aboard Mir). The mission tentatively scheduled for October
2-12, 1991 will be part of a sixteen experiment package called AUSTROMIR '91.
MIR's high inclination (51 degrees) makes it available to practically every
radio amateur in world.

The AREMIR equipment will include a modified Alnico DJ 120 E tranceiver for 2
meters (power limited to 3 watts), a TNC and CW generator for the AREMIR
beacon, and a laptop computer (which is part of the DATAMIR experiment) will
be used with the packet equipment. The exact frequency has not been
determined but it is planned to reside within the 2M amateur satellite sub-
band (somewhere between 145.8-146.0 MHz). Continuous Packet bulletins will be
36 characters long interleaved with a 6 second tone for doppler measurements.
AREMIR equipment is scheduled to be on the manifest of a Progress resupply
ship in August. Sergi (U5MIR) may set up the equipment and test it prior to
the arival of the Austrian Cosmonaut.

AREMIR has a strong educational focus and the Austrian team of hams involved
has created a special AREMIR receiver for use in Russian and Austrian schools.
The hardware for AREMIR was made possible by members of the Radio Club for
Communication and Wave Propagation (RCCW) in Gratz, Austria. The team was
lead by Nick, OE6VND and the Dean of the Polytechnical University of Gratz,
Prof. Dipl.Ing. Dr. Reidler, OE6RWD. All hardware has successfully passed all
required testing and is in Russia awaiting the trip to MIR. Two Austrian
Cosmonauts have been trained for the mission, Franz Viehbock and Clemens
Lothaller. Recent information from Russian press sources indicates that Franz
Viehbock will fly the mission. For more information on the educational
aspects of AREMIR, contact AMSAT HQ.

The Soviet Union has announced a change in mission/crew plans for the remainder of this year that may be of interest to Amateur Radio operators around the world. As many are aware, the current crew consists of Anatoli Artsebarski and Sergei Krikalev (U5MIR). Sergei has been active on the ham bands and was slated to return to earth in October. However, a recent article in Red Star reported that the Soyuz TM14 mission has been cancelled and the crew for Soyuz TM13 has been changed. The result is that Sergei WILL NOT be coming home in October. Instead, he will be joined by his old mission commander, Alexander Volkov (U4MIR) and Sergei will be staying on for another 6 months for a total time in orbit of approximately one year. The Austrian cosmonaut, Klemens Lotaller, will also fly as planned on the October mission for a short term stay so there will be Internationals possible in the early part of October.

These mission changes are due to budgetary problems within the Soviet space program.

[Info via Gustave Paier, OE3GPA, ANS, and Ed O'Grady, KE2VC]

* SATELLITE OF THE WEEK *
==========
The "Satellite Of The Week" feature is in response to numerous requests for amateur satellite transponder passband and beacon frequency information. All active amateur satellites will be covered in upcoming weeks.

Name : AMSAT-OSCAR-13, NASA Catalog Number: 19216, Launched on 15-Jun-88
Orbit : High-altitude, elliptical, synchronous transfer, Phase 3, Molniya

AO-13 Beacons include:

Mode B General : 145.812 MHz
Mode B Engineering : 145.985 MHz
Mode JL General : 435.652 MHz
Mode S General : 2400.664 MHz

The General Beacons provide text messages and selected telemetry data in formats including CW (5 minutes on the hour and half hour), RTTY (5 minutes at 15 and 45 minutes past the hour) and 400 bps PSK. RTTY is sent at 50 baud Baudot using 170 Hz shift.

Transponder Uplink Passband Downlink Passband

Mode B 435.423 MHz.. 435.573 MHz 145.975 MHz.. 145.825 MHz
Mode J 144.423 MHz.. 144.473 MHz 435.990 MHz.. 435.940 MHz
Mode L 1269.641 MHz..1269.351 MHz 435.715 MHz.. 436.005 MHz
Mode S 435.602 MHz.. 435.638 MHz 2400.711 MHz..2400.747 MHz

The newly announced AO-13 transponder schedule which is expected to continue through 15-AUG-91 is as follows:

Mode-B : MA 000 to MA 165 | Perigee eclipses:
Mode-JL : MA 165 to MA 190 | Minimum 6, Typical 29, Maximum 60 minutes
Mode-LS : MA 190 to MA 195 | until end 1991.
Mode-S : MA 195 to MA 205 | <= Mode-B transponder is OFF!!
Mode-B : MA 205 to MA 256 |

Omnis : MA 240 to MA 060 |

Please DON'T uplink to mode-B 195-205; it interferes with Mode S operations.
Once Magnetorquing is completed the anticipated Spacecraft attitude will be
BLON = 210, BLAT = 0

1584. ICOM IC-2410 story?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-03 16:32:16 UTC
From: ker@cbnewsj.cb.att.com
Message-ID: <1991Aug3.163216.7884@cbnewsj.cb.att.com>
Source record: 294759

Does anyone know what's happening with these radios?

Did you ever notice that the add for this radio has the display showing
black LCD digits on an orange background BUT the flyer from ICOM shows
orange digits (LED?) on a black background?

I've heard that the 2410 actually arrived at some dealers with the
orange digit displays but they are being sent back to ICOM because
no one can see the display in their car in daylight.

I also heard that ICOM will be re-issuing these radios with the LCD
display but it won't be for another month.

Can anyone reveal the real story as to what is happening with the displays.
Did anyone ever see a 2410? If so, what kind of display does it have?

Has anyone seen these radios for sale; in stock?

>I have to ask myself, do I belong to this group?

>So, now that I have your attention, either start thinking positive,
>take it to .policy where I can't read it, or suffer the reincarnation
>of some of your favorite kill file nominees.

Pardon me Sir? It's A-OK then for you to refer to other hams as "cliquish techno-nerds", and later in your message here as "antenna-beanied hams running into their local RS". And to also espouse talking to unlicensed operators over hams that have obtained their tickets... but you want ME to take any discussion of this to a group that YOU can not read? Ummm, well.... Realize Sir (you never have given your name) that this discussion is centered around YOUR comments and not whether or not Radio Shack sells 2 meter rigs. That was what it started as, but it is that no longer hence the change of the subject line.

Here are some unsolicited suggestions and opinions from me to you and for that matter ... anyone else:

1. If you read something in this news-group that bothers you... don't read any more about it, then you won't have to suffer anymore. Personally I do not want to see you or any other individual suffer from being FORCED to read ANYTHING!

2. If other peoples opinions bother you so much that you post a public reply, then you can expect to get one yourself. That's the way news-groups work.

3. If you want to see flame battles started, then refer to fellow hams as antenna-benied, cliquish techno-nerds, and espouse talking to unlicensed operators. It's a given that some poor fool (like me) will get sucked into replying to it! :-)

4. It is an interesting fact of human nature that people like to talk to other people that have the same interests. What appears to also be a fact of human nature is that other people resent those that talk about something that they do not understand, and attach labels to such people like "cliquish techno-nerds". These same people also do not like behavior that is different from their own (people that wear antenna beanies) and tend to deride that too. Some people do not even want to see DISCUSSIONS of things that they do not agree with (like worrying about a growth in unlicensed operators from a possible massive influx of easily available radios) and at some point in time become so disgusted that they would rather see a whole new group come into play (unlicensed operators) rather than allow these "other people" to continue their existence. While I support your right to think anyway that you want to, I am one of those that does not want to see that way of thinking become the norm, thus I will fight it publically and privately at every opportunity.

So... blast away at me all you want. I like Techno-nerds (I learn from them), I laugh at antenna-beanied hams (they show a strength of character that is beyond mine), and I am concerned about the future of amateur radio and anything that can affect it, and am willing to listen to and discuss ANY-THING that addresses that issue.

Instead of sending the FAQ files as a bunch of little (i.e., sort enough for the packet radio network) files, why not send it as a single large file so it's easier to A) store if you want to, or B) ignore if you want to.

Usenet and the internet have NO problem with files of that modest size.

We apologize for the delays in getting this report out. We have had some problems with our mailer.

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
August 02 to August 11, 1991

Report Released by Solar Terrestrial Dispatch
P.O. Box 357, Stirling, Alberta, Canada
T0K 2E0
Accessible BBS System: (403) 756-3008

Based In-Part from Data Supplied By
The Space Environment Services Center

SOLAR TERRESTRIAL REVIEW FOR 26 JULY TO 01 AUGUST

Solar activity this week was mostly moderate. The most outstanding events occurred from Regions 6749 and 6757 which both produced powerful X-class flares near the central solar meridian.

Region 6749 spawned the first X-class flare of the period. The flare began at 00:45 UT, peaked at 00:52 UT and ended at 01:24 UT on 31 July. The event was rated a class X2.3/2B tenflare and was located at S18E12. Weak Type II and Type IV sweeps accompanied this event.

Region 6757 produced the second major X-class flare of the period. This event was rated a class X1.5/2B tenflare and was located at N25E15 on 02 August. The energetic event began at 03:06 UT, peaked at 03:18 UT and ended at 03:39 UT on 02 August. This flare was associated with a strong, but relatively short duration Type IV sweep. A Type II was not present.

Other activity included an M7.2/1N from departing Region 6734 (N14W58) at 07:10 UT on 30 July, an impressive M4.0/2B parallel ribbon flare from Region 6749 at 15:21 UT on 01 August, and an impressive large hedgerow prominence eruption out to 0.32 solar radii at 15:30 UT on 01 August on the northeast limb between N13 and N42.

Geomagnetic activity was mostly quiet throughout the week. A minor geomagnetic storm (gradual commencement) began near 06:00 UT on 02 August and remains in progress at the present time. The cause of this activity is thought to be the major class X2.3/2B flare of 31 July. Periods of major storming have been observed thus far, particularly over the high latitude regions. Other activity this week included a sudden magnetic impulse of approximately 25 nT at 05:58 UT on 30 July which was followed by a period of

active conditions.

Auroral activity was dormant this week prior to the minor geomagnetic storm commencement. Only high latitudes experienced occassional isolated periods of low to moderate activity. Lunar phase has inhibited attempts to view activity optically. Auroral activity has increased to generally moderate levels at the present time. More details regarding this event will be presented with next weeks STFR report.

HF propagation conditions this week were the best and most stable in quite some time. Low geomagnetic and auroral activity, high solar indices and relatively little SWFs provided generally very good propagation conditions over the low and middle latitudes for much of the period. By the end of the week, M-class flaring had increased and SWFs began to interfere with propagation conditions over sunlit paths. Despite this, conditions remained normal to above normal. By the end of 01 August, geomagnetic activity had increased and propagation conditions began to show signs of degradation. At the present time, notable HF degradation has been observed over all latitudes, although no significant degradation has been observed over the low to central middle latitudes. The northerly middle and high latitude regions are suffering generally fair to poor propagation conditions.

Conditions this week were generally unfavorable for VHF scatter-mode propagation. However, MUFs increased this week and may have provided brief openings on 6 meters. If successful communications on 6 meters was observed this week, please send a note to: Oler@Hg.Uleth.Ca or to: COler@Solar.Stanford.Edu.

SHORT TERM SOLAR TERRESTRIAL FORECAST

We are in the declining phase of solar indices. Despite the falling indices, occassional major flaring will be possible particularly from Region 6757 which has exhibited strong growth and flare activity over the last week. Another major flare could erupt from this region within the next 24 to 72 hours. M-class flares are very likely to be observed from this region, and could also be observed from Region 6749. Region 6734, which spawned several X-class flares early in its rotation has now departed from view beyond the west limb. It crossed the west limb quietly. The other cluster of regions on the west limb will also depart shortly.

The uncertainty regarding major flaring is keeping confidence levels lower than normal. If no major flares are observed this next week, geomagnetic activity should become generally unsettled until 06 or 07 August when coronal hole effects should again elevate geomagnetic conditions to mostly active levels. The only exception to this may be 04 and 05 August, when an impact from the class X1.5/2B flare of 02 August may be observed. If this impact materializes, generally active to possibly minor storm conditions could develop for approximately 24 hours.

If a major energetic flare should erupt, further geomagnetic storming could be observed. This will remain a rather uncertain and unstable period for geomagnetic and auroral activity.

Auroral activity should remain mostly low to moderate over the high and northerly middle latitudes barring major flares. If no major flares are observed, the activity should remain confined to the high latitude and northerly middle latitude regions. Between approximately 06 and 10 August, coronal hole effects could impinge on auroral activity. During this period, northerly middle and high latitude regions could witness generally low to moderate levels of activity. There is also a slight risk for central middle latitude auroral observations during this period, particularly on 08 and 09 August. If a well placed major flare should erupt, the forecasts contained in this report may need to be disregarded. Watch for possible warnings or flare alerts for additional information. Consult the STD BBS for 24 hour forecasts and daily updated long-range forecasts.

HF propagation conditions will remain near normal over the next week. The present disturbance is stabilizing and may be followed on 04 August by a disturbance from the class X1.5/2B flare of 02 August. Conditions on 04 August should be similar to what has been observed with this present disturbance. Consult the STD BBS for various 72 hour HF forecasts.

VHF propagation conditions will be normal over most latitudes. High latitudes may experience some signal degradation on 04 August accompanying the interplanetary disturbance launched by the class X1.5/2B flare of 02 August. Northerly middle latitudes may also experience some degraded signal conditions. The high and northerly middle latitudes may observe localized periods of auroral backscatter or periods of fairly strong auroral sporadic E on 04 August. Consult the STD BBS for 72 hour VHF forecasts. There exists a slight risk for favorable VHF scatter conditions this week, dependent on whether an energetic major flare erupts. Watch for possible alerts or warnings.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 02 AUGUST

NOTES:
The data above represents preliminary planetary geomagnetic activity.
Data from many magnetic observatories around the world are used in
constructing the above chart. The first graph line for each day represents
geomagnetic activity which occurred between 00 UT and 03 UT. The second
graph line represents activity which occurred between 03 UT and 06 UT, etc.
For information regarding the interpretation and/or use of these charts, send
a request for the document "Understanding Solar Terrestrial Reports" to:
"Oler@Hg.Uleth.Ca" or "COler@Solar.Stanford.Edu". This document, as well as
others and data/forecasts exist on the STD BBS at: (403) 756-3008.

CONFIDENCE LEVEL: 65%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

```

Cumulative 60 day Solar Activity Record
Start Date: June 5, 1991

NOTES:
Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be expected for related solar flux values. Plot lines

labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

GRAPHICAL 20-DAY SOLAR ACTIVITY PREDICTION

The 20-Day Graphical Solar Activity Forecast is UNAVAILABLE at the present time. The forecast will be placed on the STD BBS when it becomes available. We apologize for any inconvenience this may cause.

NOTES:
These VHF DX prediction charts are defined for the 50 MHz to 220 MHz
bands. They are based primarily on phenomena which can affect VHF DX
propagation globally. They should be used only as a guide to potential
DX conditions on VHF bands. Latitudinal boundaries are the same as those for
the HF predictions charts. For more information, request the document
"Understanding Solar Terrestrial Reports" from: "Oler@Hg.Uleth.Ca" or
"COler@Solar.Stanford.Edu". This document, as well as others and related
data and forecasts exist on the STD BBS at: (403) 756-3008.

I'am looking at an old QSL from A35CR and it is Tonga Is. Unless
it has been changed since then :-).

/\

SOLAR TERRESTRIAL BULLETIN

04 August, 1991

Graphical Solar Maps & Plots Available

/\

HIGH RESOLUTION GRAPHICAL SOLAR MAPS AND DATA PLOTS ARE NOW AVAILABLE

Solar Terrestrial Dispatch has begun providing high resolution graphical solar region and coronal hole maps and data plots in the form of GIF files on the STD BBS. Each GIF file is approximately 15 K in size and should take about 1 minute to download at 2400 baud. IBM or compatible software to view these images are available for download or may be obtained through anonymous FTP from a number of sites (for almost any type of computer system).

The solar region and coronal hole maps will be updated daily. These images will provide all those who are interested with accurate information regarding the size and locations of the various solar regions, as well as the approximate shape and the polarity of solar coronal holes and their positions relative to the active regions.

STD has also begun providing high-resolution data plots in GIF format. The high-resolution x-ray plots for the last major X and M-class flares as measured by both GOES-6 and GOES-7 spacecraft are now available in GIF format. Special GIF images of these plots are also available in black and white for making hard-copies on printers.

Regular proton plots, PCA plots, neutron monitor plots and magnetometer plots will also soon be available on the STD BBS in the widely-recognized GIF format. Other solar or miscellaneous images will be placed on this system as they become available.

To connect to the system, dial the phone number: (403) 756-3008. The protocol used is: 8-bit words, no parity, and one stop bit. Supported communication rates are: 300, 1200, and 2400 baud. This system operates 24 hours a day, 7 days a week.

** End of Bulletin **

Subject: FAQs - part 1 of 4

| 30-Jul-91 10:10 dls update, see changebars (|)
The following is a monthly posting of frequently asked questions for
Amateur Radio. Due to the increasing size of this list, I've broken it into
4 Parts (and will break it further if necessary) to keep each Part under
10K bytes.
Part 1 - Beginning Amateur Radio questions
Part 2 - "Where can I find ..." computer questions
Part 3 - Amateur Radio Organizations and Publications
Part 4 - Common Advanced and Technical questions
If you have any questions you think should be added, please email to me at
dls@genrad.com.
This FAQ should ONLY be reposted once a month. If someone asks a question
that is answered by this FAQ, I suggest emailing to that person, or,
alternately, post only the section that answers the question, NOT the entire
FAQ posting. Read news.announce.newusers for proper net etiquette.
|This FAQ is available via anonymous FTP from ftp.cs.buffalo.edu.

FREQUENTLY ASKED QUESTIONS
Part 1 - Beginning Amateur Radio questions

Table of Contents:
** What is Amateur Radio?
** Who can become a ham in the United States?
** OK, so how do I become a ham in the United States?
** Where can I locate information and books on Amateur Radio?
** How much does it cost?
** Where can I take the tests?
** What are the tests like?

** What can I do with a ham radio license?
** What can't I do with an Amateur Radio license?
** I'm interested, who will help me?
** Should I build my own equipment?
** Should I build my own antenna?
** Do I need a huge antenna and tower like my neighbor?
** Where do I buy equipment?
** I've only got one 'meter' on the front of my radio - does this mean
it's a 'one meter' radio? (Wow - some guys have 80 of 'em??? :-)

** What is Amateur Radio?
Amateur Radio is a non-commercial radio communication service
whose primary aim is public service and communication between
private persons. Amateur Radio operators are commonly called
hams. It's great fun to talk to someone in Japan on the radio!
Here's one ham's description of Amateur Radio: "Climbing towers,
roofs, trees, or any other fixed object to hang antennas. Restoring
ancient equipment to operation. Playing with glitzy new equipment.
Blowing up finals. Cutting holes in your (or your buddie's) car.
Building your own stuff. Wiping out your neighbor's TV and then
having to explain and fix it. The joy and magic of communicating
with someone half way around the world with a few bits of glass and
wire."

** Who can become a ham in the United States?
Anyone who is not a representative of a foreign government can
be an Amateur Radio operator in the USA. There are tests that
you must pass to get a license, however the tests are not
insurmountable. There are 7-year-old hams and 80-year-old
hams. There are many handicapped hams who get great enjoyment
out of Amateur Radio.

** OK, so how do I become a ham in the United States?
There are now two entry-level class licenses in Amateur Radio.
A Novice license requires passing a 30-question written test
and a Morse code test given at 5 words per minute. A Technician
license requires passing the 30-question written Novice test and
a 25-question written Technician test, but no Morse code test.
See local radio clubs or radio stores in your area for more
information. Note that you can get a higher class license instead,
simply by passing the required tests.

** Where can I locate information and books on Amateur Radio?
Your local Radio Shack sells some ham radios and Amateur Radio
license books. Books can also be obtained through the mail
from ham radio organizations, such as ARRL in Newington, CT
(203-666-1541) and W5YI in Dallas, TX (1-800-669-9594). There
may be one or two ham radio stores in the local area (ie,
within 50 miles). Try looking in the Yellow Pages under Radio
Communications. Be assured that once you get a callsign, the
mail order ham radio companies will find you :-).

For the Novice license, get a Novice License manual, plus 5-word-per-minute Morse code tapes, costing around $25. For the Technician license, get a Novice License manual, a Technician License manual, and an FCC Rules manual, costing around $32. The FCC Rules manual is a good idea for Novice also, but not necessary, since the Novice License manual contains all the FCC Rules that are required for the Novice License.

** How much does it cost?
To take the Novice tests, it's free. To take the Technician or higher class tests, there is a small charge (around $5 currently) to cover copying costs and running the testing sessions. The cost of a radio is really dependent on what you want to do. You can make your own radio and antenna for under $150. You can buy a used single-band radio for $150-$300. Or you can buy a new multi-band multi-mode radio with all the doodads for $300-$3000. I'd suggest you learn more about ham radio, talk to local hams, find out what you want to do with ham radio first.

** Where can I take the tests?
The Novice tests can be given by any two qualified hams of General class license or above. The Technician tests and all higher class license tests are given by three qualified Volunteer Examiners (VEs) who volunteer their time.

** What are the tests like?
Each of the written tests (Novice, Technician, General, Advanced, and Extra) are generally a multiple choice test of approximately one-tenth of the question pool. For example, if the question pool is approximately 300 questions, then the test will be a 30-question test. You need to get 75% correct to pass. Note that they truncate to determine the correct number of questions. That means for a 30 question test, you need to get 22 right, which is actually only 73.3%.

Once you've paid the small fee for Technician-Extra tests, it costs no extra to take another test, so I'd suggest you keep taking the next more advanced test until you fail. If you pass the written but not the Morse code (or vice versa) for a specific class license, you have up to one year to take the other test before you would have to retake the written test again. Note that some VEs will not allow you to take the written test unless you've first taken the Morse code test.

The Morse code test is a receiving test only. The test run 5 to 7 minutes. After the test, you are given a 10-question multiple-choice or fill-in-the-blank test. Passing grade is 7 or more. If you fail the 10-question test, the examiner team will examine your copy sheet to see if you have 1 minute of solid copy with no errors. For 5 wpm, that's 25 characters, for 13 wpm, that's 65 characters, for 20 wpm, that's 100 characters. If they can find 1 minute solid copy, you've still passed.

Hints on Morse code tests: Generally, it will be a standard QSO (conversation), and it MUST contain at least one of each of the following:
26 letters A-Z, 10 numbers 0-9, comma (,), period (.), slant or slash (/), question mark (?), double dash prosign (BT), end of message prosign (AR), end of contact prosign (SK).
The letters count as one character, all others count as two characters. There are a couple other prosigns which are worth knowing, but will not be on the test, like "I'm done talking, next" is K, "I'm done talking, back to you" is KN, "Please wait" is AS.

** What can I do with a ham radio license?
There are so many things, it's a difficult question to answer, but here's some ideas:
* Talk to people in foreign countries.
* Talk to people (both local and far away) on your drive to work.
* Help in emergencies by providing communications.
* Provide communications in parades or walkathons.
* Help other people become hams.
* Hook your computer to your radio and communicate by computers.
* Collect QSL cards (cards from other hams) from all over the United States and foreign countries and receive awards.
* Participate in contests or Field Day events.
* Provide radio services to your local Civil Defense organization thru ARES (Amateur Radio Emergency Service) or RACES (Radio Amateur Civil Emergency Service).
* Aid members of the US military by joining MARS (Military Affiliate Radio System).
* Have someone to talk to on those sleepless nights at home.
* Receive weather pictures via satellites.
* Build radios, antennas, learn some elctronics and radio theory.
* Talk to astronauts in space, or use the moon to bounce signals back to people on the Earth.
* Experiment with Amateur TV (SSTV) or send still-frame pictures by facsimile.
* Experiment with amateur satellite communications.

** What can't I do with an Amateur Radio license?
The most important thing you can't do is transact business of any kind over ham radio. Interference to other hams or services, as well as obscene, profane or indecent language is not tolerated and is illegal. Music and broadcasting are not allowed on ham radio. Some personal conversations may not be appropriate to Amateur Radio. Do you really want the whole world to hear about Aunt Mabel's hemorrhoids?

** I'm interested, who will help me?
There are hams who are willing to become "Elmers" (mentors, helpers) in your local area. Look around and ask local hams. Search out local radio clubs. As well, some people have volunteered to be an Elmer over the Usenet. Paul has volunteered to maintain that list. If anyone wants to be an Elmer, or needs an Elmer, email him:

Paul W. Schleck, KD3FU, acmnews@zeus.unomaha.edu

** Should I build my own equipment?
"Homebrewing" is a fun and educational part of ham radio. It is a thrill to build your own transmitter and put it on the air. However, building your own receiver can be quite complicated; if you don't have electronics experience, you may want to buy a receiver instead. Most homebrew transmitters are QRP (transmit very low power). That's fine for an experienced ham with a very good antenna, but a Novice ham will just get frustrated. Your first rig, therefore should NOT be a home-brew.

** Should I build my own antenna?
Most hams build their own antennas for base station use and buy antennas for mobile (car) use. Most beginner ham books describe how to build different types of antennas. Order of difficulty, from easiest to more difficult, for some common antennas are: wire dipole, Zepp, Yagi, Quad.

** Do I need a huge antenna and tower like my neighbor?
No! Large beam antennas and 40-foot towers are very expensive. As a beginner, a simple dipole antenna is perfectly adequate. As you gain experience (and money :-), you may want to invest in something bigger.

** Where do I buy equipment?
If you can afford new rigs, there are many mail order stores that advertise in ham radio magazines. If you want to buy a used rig, the best place is at a "hamfest" (ham flea market). You should take along an experienced ham, since some of the used equipment may be inoperative, overpriced or poor quality. You can also answer ads in ham magazines or posted at ham radio stores, although often, by the time you call, the equipment has already been sold.

** I've only got one 'meter' on the front of my radio - does this mean it's a 'one meter' radio? (Wow - some guys have 80 of 'em??? :-)
Meter refers to the wavelength of the signal at which you are transmitting. There is a inverse relationship between the frequency (specified in kilohertz or megahertz) and the wavelength (specified in meters or centimeters).

Subject: FAQs - part 3 of 4

| 30-Jul-91 07:46 dls update, see changebars (|)
The following is a monthly posting of frequently asked questions for
Amateur Radio. Due to the increasing size of this list, I've broken it into
4 Parts (and will break it further if necessary) to keep each Part under
10K bytes.
Part 1 - Beginning Amateur Radio questions
Part 2 - "Where can I find ..." computer questions
Part 3 - Amateur Radio Organizations and Publications
Part 4 - Common Advanced and Technical questions
If you have any questions you think should be added, please email to me at
dls@genrad.com.
This FAQ should ONLY be reposted once a month. If someone asks a question
that is answered by this FAQ, I suggest emailing to that person, or,
alternately, post only the section that answers the question, NOT the entire
FAQ posting. Read news.announce.newusers for proper net etiquette.
|This FAQ is available via anonymous FTP from ftp.cs.buffalo.edu.

FREQUENTLY ASKED QUESTIONS
Part 3 - Amateur Radio Organizations and Publications

Table of Contents:
** Where can I find VE sessions in my local area?
** How do I use the incoming and outgoing QSL bureau?
** Are there any news groups for CAP?
** What's the name of the QRP club that issues QRP numbers?
** Can I send ARRL electronic mail?
** What magazines are available for Ham Radio?
** How do I join MARS?

** How do I join RACES?
** What organizations are available to help handicapped hams?
** Is there any information on antique radios?
** I am looking for a specific ham, can anyone help me find him?
** Is there an on-line copy of the FCC Part 97, or FCC Amateur Radio
allocations?
** Can I post my neat new ham related program on rec.radio.amateur.misc?

** Where can I find VE sessions in my local area?
VE sessions are often announced in the local newspapers, but more
often, they are announced by local radio bulletin boards. The
local packet BBS will most likely have a monthly updated schedule
for VE sessions. ARRL or W5YI can generally be called and asked for
local VE sessions as well. Don't forget that you will need the
following when you go in for an upgrade: a copy of your current
Amateur license; your original Amateur license; any CSCEs (duplicate
not required), if applicable and less than a year old; a picture ID,
preferably a driver's license, passport or visa; and the VE test
fee (approximately $5 right now).

** How do I use the incoming and outgoing QSL bureau?
To use the outgoing QSL bureau, you must be a member of ARRL. In
general, you send a bundle of foreign (not States!) QSL cards to
the outgoing bureau in Newington, Connecticut, along with a label
off of your QST magazine (which shows ARRL membership), along with
$2 per pound of cards (approximately 150 cards) or $1 for 10 cards
or less.

To use the incoming QSL bureau, you do NOT have to be a member of
ARRL. Send one or more Self-Addressed Stamped Envelopes (size 5x7
or 6x9, no bigger, no smaller) with one ounce of postage attached
and with your callsign in 3/4" letters in top left hand corner where
the return address label would go. If you expect a large quantity
of foreign QSL cards, attach extra money or postage with a paper
clip. Send the envelopes to the QSL bureau for your callsign area.
If your callsign is xx3xxx/5, you would send it to the 3rd call
area, NOT the 5th call area. Addresses for QSL bureaus are listed
in QST; if you don't have access to a QST magazine, ask another
ham. IMPORTANT: BE PATIENT! Turnaround time for a US QSL bureau,
not considering foreign QSL bureaus, is about 3 months. Foreign QSL
bureaus and hams can be as fast as 2 months or as slow as TEN YEARS,
while average is about 6-12 months.

** Are there any news groups for CAP?
There is no news group just for Civil Air Patrol discussions. However,
rec.aviation is appropriate for CAP aviation discussions and for
CAP radio information, these rec.radio.amateur.* groups are available.
In addition, there is a mail digest just for CAP. Subscribe by
emailing to capital-request@cps.udayton.edu. Submit articles by
emailing to capital@cps.udayton.edu. CAP related files are also
stored on the FTP site sunburn.cps.udayton.edu in pub/capital.

** What's the name of the QRP club that issues QRP numbers?
QRP Amateur Radio Club International, c/o Bill Harding K4AHK,
10923 Carters Oak Way, Burke, VA 22015.

** Can I send ARRL electronic mail?
Several ARRL HQ staffers can be contacted via the net, using the
address username%arrlhq.UUCP@uhasun.hartford.edu, replace username
as shown below:
Jon Bloom, KE3Z, Laboratory Supervisor jbloom
Tammy Bosco, Technical Secretary tbosco
Ed Hare, KA1CV, Laboratory Engineer ehare
Rus Healy, NJ2L, QST Asst Tech Ed, Product Rev rhealy
Dave Newkirk, WJ1Z, QST Asst Tech Ed, Hints dnewkirk
Paul Pagel, N1FB, QST Asst Tech Ed, Tech Corres ppagel
Mark Wilson, AA2Z, QST Managing Editor mwilson
Technical Information Service, tech questions tis

For other questions (VE program, Field Organization matters, ARRL
policy issues, etc.), try 2155052@mcimail.com, which sends them to
the front office.

** What magazines are available for Ham Radio?
Your local ham store may have some, but here's some popular ones
(this is NOT a complete list!):
QST, ARRL, 225 Main St, Newington, CT 06111 - basic projects and
contesting
CQ The Radio Amateur's Journal, 76 North Broadway, Hicksville, NY
11801 - beginner ham radio articles
73 Amateur Radio Today, WGE Center, Forect Rd, Hancock, NH 03449,
FAX (603) 525-4423, email: COMPUSERVE 70310,775 or Internet
70310.775@compuserve.com - more technical ham radio articles
QEX, ARRL, 225 Main St, Newington, CT 06111 - more technical projects
WorldRadio, 2120 28th St, Sacramento, CA 95818, (916) 457-3655.
Subscriptions to 201 Latrhop Way, Ste D, Cacramento, CA 95815,
(800) 365-SUBS - lots of special interst columns, like QRP,
ATV, YL, etc.
W5YI Report, PO Box 565101, Dallas, TX 75356, 1-800-669-9594 -
up-to-date information on Amateur Radio happenings, including
VE information and statistics

** How do I join MARS?
To join MARS, you have to be 14 years or older (parental consent
required under age 17), be a US citizen or resident alien, possess a
valid Amateur Radio license, possess a station capable of operating
on MARS HF frequencies, and be able to operate the minimum amount
of time for each quarter (12 hours for Army and Air Force; 18 hours
for Navy-Marines). Novices must upgrade to Technician within 6
months, else be dropped from MARS. No-Code Techs can apply, provided
they have transmit and receive HF capability for MARS frequencies
(they don't need transmit capability for Amateur HF frequencies). For
application forms contact:

Chief, Air Force MARS
TIC/DLTXM
Scott AFB, ILL 62225-6001
(618) 256-5552. Or, contact via Internet goes to
__daniels@server.af.mil, put "Pass to MSgt Trimmer" in subject line.

Chief, Army MARS
HQ, US Army Information Systems Command
ATTN: AS-OPS-OA
Fort Huachuca, AZ 85613-5000

Chief, Navy-Marine Corps MARS
Naval Communication Unit
Washington, DC 20397-5161

** How do I join RACES?
Contact your nearest Civil Defense or Emergency Management Agency.
The Radio Amateur Civil Emergency Service is a part of a municipal,
county, or state government. This does not mean, however, that
every such government has a RACES program. If your government does
not have a RACES, ask them to refer you to the nearest jurisdiction
that does have a RACES program.

** What organizations are available to help handicapped hams?
Courage Center
Handihams
2915 Golden Valley Rd
Golden Valley, MN 55422
(612) 520-0515
ARRL has a Handihams information package (get it by requesting it
thru 2155052@mcimail.com) and a book called "The ARRL Plan for the
Disabled", available at no charge from the ARRL Regulatory
Information Branch.

** Is there any information on antique radios?
Antique radio classifieds: ARC, PO Box 802-B6, Carlisle, MA 01741 -
old radios, TVs, ham equipment, 40s and 50s radios,
telegraph, books, etc.
Hallicrafter Service manuals: Ardco Electronics, PO Box 95, Dept Q,
Berwyn, IL 60402
Antique Wireless Association, Bruce Kelley, W2ICE, Route 3, Holcomb,
NY 14469 - sponsors the Wireless Museum

** I am looking for a specific ham, can anyone help me find him?
Rather than sending out a message on Usenet, you might first try
directory assistance from the phone company or the locator service
provided by the Salvation Army. A Salvation Army post in your
local area may be able to help you. If you have his/her callsign
or name, you might also try one of the on-line callservers shown
above.

** Is there an on-line copy of the FCC Part 97, or FCC Amateur Radio
** allocations?

Part 97 is available by ftp from wuarchive.wustl.edu, file is
mirrors/misc/hamradio/part97.txt.

** Can I post my neat new ham related program on rec.radio.amateur.misc?
This is really not a good idea, since many of the readers receive
these newsgroups as mail digests. Posting is also a one-shot thing.
If you post and someone missed it, it is gone. A better way would be
to announce the existence of your program here, along with
information on how to obtain a copy of your program. You can also
submit it to one of the FTP archive sites, which will allow the world
to access it without you having to mail it to each requestor. If you
just GOTTA post it somewhere, post it to more appropriate groups,
like comp.sources.unix or alt.sources or comp.binaries.pc.

Subject: FAQs - part 2 of 4

| 30-Jul-91 07:40 dls update, see changebars (|)
The following is a monthly posting of frequently asked questions for
Amateur Radio. Due to the increasing size of this list, I've broken it into
4 Parts (and will break it further if necessary) to keep each Part under
10K bytes.
Part 1 - Beginning Amateur Radio questions
Part 2 - "Where can I find ..." computer questions
Part 3 - Amateur Radio Organizations and Publications
Part 4 - Common Advanced and Technical questions
If you have any questions you think should be added, please email to me at
dls@genrad.com.
This FAQ should ONLY be reposted once a month. If someone asks a question
that is answered by this FAQ, I suggest emailing to that person, or,
alternately, post only the section that answers the question, NOT the entire
FAQ posting. Read news.announce.newusers for proper net etiquette.
|This FAQ is available via anonymous FTP from ftp.cs.buffalo.edu.

FREQUENTLY ASKED QUESTIONS
Part 2 - "Where can I find ..." computer questions

Table of Contents:
** I don't have a news server at my site, how can I subscribe to the
rec.radio.amateur groups?
** I can read news at my site, but I don't have posting privileges. How
can I post?
** I don't have FTP capability at my site. Can I get files via email?
|** Where can I find ftp sites that have ham-related files?
|** I'm having trouble using FTP....HELP!

** Are there any Telephone BBS's which have ham related files?
** Are there Dialup News services for Amateur Radio?
** Are there any on-line callbooks?
** Where can I find modifications for my radio to extend its capabilities?

** I don't have a news server at my site, how can I subscribe to the
** rec.radio.amateur groups?
To subscribe to rec.radio.amateur.misc, send email to:

Info-Hams-Request@ucsd.edu

In the body of the message, write:

subscribe Info-Hams

Similarly, to subscribe to rec.radio.amateur.packet, send email to
Packet-Radio-Request@ucsd.edu, message is "subscribe Packet-Radio",
and to subscribe to rec.radio.amateur.policy, send email to
Ham-Policy-Request@ucsd.edu, message is "subscribe Ham-Policy", and
to subscribe to rec.radio.shortwave, send email to
listserv@cuvma.columbia.edu, message is "subscribe swl-l (your name)".
To unsubscribe, follow directions above, changing the command word
"subscribe" to "unsubscribe". Help is available by using the command
word "help". Note that command words MUST be the first word on each
line of the message.

** I can read news at my site, but I don't have posting privileges. How
** can I post?
You can post to rec.radio.amateur.{misc,packet,policy}
by sending your posting email to Info-Hams, Packet-Radio, or
Ham-Policy, all at ucsd.edu. To post to other newsgroups, send the
posting email to (groupname)@ucbvax.berkeley.edu and for the
groupname, replace periods with dashes.
For example, to post to sci.space, you would send your posting to
sci-space@ucbvax.berkeley.edu.
All of the Amateur radio newgroups are archived on ucsd.edu under
subdirectory mailarchives/{Ham-Policy,Info-Hams,Packet-Radio}.

** I don't have FTP capability at my site. Can I get files via email?
ANY BITNET, EARN, or NorthNET site can access the Princeton mail
server. It will be most efficient if you know the complete path
and filename for an;ything you wish to transfer, but you can use
'cd' and 'ls -l' commands to move about and browse the remote site's
directories. Remember, though, that each request to the BITFTP
server may take several hours (or longer) to be fulfilled.

For access to the FTP server, send email to bitftp@pucc.bitnet (for
BITNET, EARN and NorthNET users ONLY!). Subject doesn't matter.
The text of the email is the FTP commands one after another. For
example, suppose you wanted to access the FTP site lcs.mit.edu:
FTP lcs.mit.edu
USER anonymous

PASS yourname@yoursite (not required)
ASCII
CD telecom-archives
GET filenames
BYE
A help file is available giving detailed instructions by putting
the single word HELP into the text of the email.

For nonBITNET users, there is also a FTPMAIL server at
ftpmail@decwrl.dec.com. Commands include: REPLY <mailaddr>,
CONNECT [HOST [user [pass]]], ASCII, BINARY, COMPRESS, COMPACT,
UUENCODE, BTOA, LS <directory>, DIR <directory>, GET <file>, QUIT,
HELP. Get the help file for more information by sending mail with
the single line "help". The ftpmail site may complain if you try
try to get more than 1 file per email request. Here is an example
of a request:
reply your_name@your_site
connect uxc.cso.uiuc.edu
binary
uuencode
get pub/ham-radio/Tech.v3.3.sit.hqx.Z
quit

A note on the use of FTP mailservers: If you want to use FTP
mailservers, like FTPMAIL, please be considerate of any systems that
your mail must pass through. The quickest way to find yourself cut
off from the world is to make the admins of sites that pass your mail
pass 60Mb of X11 graphics system source. If you need large amounts
of information from a mailserver, contact your admin for help -- it
may already be available, or he may know a better way to get it.

** Where can I find ftp sites that have ham-related files?
There is a fairly definitive list of anonymous FTP sites available
from pilot.njin.net under subdirectory /pub/ftp-list in file ftp.list.
You can also have the latest copy (published monthly) via mailing
list by emailing to odin@pilot.njin.net, subject "listserv-request",
body of message "send help". Revision info for the ftp list should
be send to odin@pilot.njin.net.

General files for any computer and informational archive:
ftp.cs.buffalo.edu (submissions to this ftp site should be made to
bowen@cs.buffalo.edu) - contains many ham radio files,
including the FAQs, Elmer list, SWL and scanner info and
the KA2UGQ worldwide BBS list on ~pub/ham-radio/phone_bbs_list
freja.diku.dk - mirror image of ~pub/ham-radio on ftp.cs.buffalo.edu,
for access by Northwestern European countries only (server is
in Denmark)
wsmr-simtel20.army.mil (submissions to this ftp site should be made
to w8sdz@wsmr-simtel20.army.mil) or wuarchive.wustl.edu (ONLY
BITNET users!) - these are mirror images of each other - These
contain ham radio mods and ham radio software

A wide assortment of files covering many topics can be
obtained from the SIMTEL archives. If you cannot directly FTP
from wsmr-simtel20, there is a mail server that can help.
Send mail with the text "help" to listserv@vm.ecs.rpi.edu.
quiche.cs.mcgill.ca (comments to archie-l@cs.mcgill.ca) - contains
ham related software on /pub/ham-radio and /hamradio, including
the FAQs, Elmer lists and geoclk (try the command 'prog geoclk'
| to find all files whose name contains "geoclk") ***NOTE***
| This Archie site is no longer available. Does anyone have
| the new FTP site for Archie?
| martini.eecs.umich.edu 3000 - contains a Geographic Name Server
| archive.cs.ruu.nl, armstrong.cs.buffalo.edu, sol.cs.ruu.nl -
| contains the FAQs for rec.radio.amateur (may not be current)
ftp uxc.cso.uiuc.edu, log in as "anonymous", password is your email
address, cd pub/ham-radio - This contains the HyperCard
Hamstacks written by Diana Syriac as well as ASCII readable
ham radio question pools
apple.com, cd pub/ham-radio - Ham software and information, especially
MacIntosh software

Amiga computers:
ab20.larc.nasa.gov - don't know if there are any ham files here.

|** I'm having trouble using FTP....HELP!
| Here's some hints to check what's wrong:
| * If on Internet, does it support telnet and/or FTP? Not all sites do!
| * Can you telnet to other hosts and get a login prompt?
| * If on Internet and telnet or FTP is supported, is there a host table
| or name server lookup capability on your host that can parse a
| fully qualified domain name, like marvin.cs.buffalo.edu?
| * If you get "host not in host table" or "host unknown" or similar
| error, try telnetting via the IP number, a set of four 1-3-digit
| numbers separated by periods (eg, 137.48.1.1). The exact IP number
| for the site can be obtained via the nslookup utility, if your
| computer supports it....or check the FAQs.
| * If telnet is supported and you can telnet to the default login
| port (ie, no qualifiers), then the manner at which the socket
| qualifier is entered may be system dependent.
| * Syntax for FTPing from different operating systems differ. Berkeley
| Unix or VMS with Wollongong TCP/IP uses syntax:
| telnet <host> <socket#>
| Other possibilities to try:
| telnet console <host>
| telnet <CR> open <host>:2000
| telnet <host>/2000
| * If all else fails, ASK your system administrator or check system
| documentation.

** Are there any Telephone BBS's which have ham related files?
WB3FFV has one, phone is 301-625-0817 for 1200 and 2400 baud modems.
This also supports UUCP. Login is uucpanon, no password. For a

listing of available archived, try:
uucp wb3ffv!~/FILES /usr/spool/uucppublic

** Are there Dialup News services for Amateur Radio?
There are two major news services for ham radio. Both are run by volunteer hams and provide bulletins of specific interest to amateurs, hence they are perfectly legal to rebroadcast on ham bands according to FCC Regulation 97.111B(6). To lessen the load on the dialup lines, consider getting your local repeater operator to rebroadcast it, or tape record it to play at your favorite HF net.

RAIN (Radio Amateur Information Network) is produced by Hap Holly, KC9RP, located in Illinois. The news is typically updated 8am CST Fridays. Phone numbers are 1-708-299-INFO (299-4636) and 1-708-827-RAIN (827-7246).

NEWSLINE is another, produced by Bill Pasternak, WA6ITF. Donations for NEWSLINE are accepted at Newsline Support Fund, c/o Dr. Norm Chalfin K6PGX, Pasadena, CA 91102. Phone numbers are:
Chicago 1-708-289-0423
N.Florida 1-407-259-4479
Los Angeles 1-805-296-2407

** Are there any on-line callbooks?
If you are at an Internet site you can connect using telnet to one of the two primary servers:

callsign.cs.buffalo.edu (currently 128.205.32.4)
ham.njit.edu (currently 128.235.1.10) (alias plan9.njit.edu)

The servers sit on port number 2000 which is a different port number than what telnet usually defaults to. So if you just telnet to these machines, you will get a login prompt instead of the server. How you tell your telnet program to connect to port 2000 instead of the default port is operating system dependent but it is usually done with a line like

telnet callsign.cs.Buffalo.EDU 2000

If this doesn't work, consult your local systems guru for the proper command string.

The interactive servers are designed to be somewhat self-explanatory and they support fairly detailed help facilities. The first command you should execute when connecting to one of these servers is "info". This will list general info about that server and how to use it. You should then type "help" to list the various commands available. Typing "help" followed by a command name will give you a little more detail about that command. Servers allow searches by call, last name, zip code or city and also provide regular expression filters to trim your searches so you get a reasonable amount of output.

Both these servers are built from a database distributed by Rusty Carruth, N7IKQ. This database currently contains US and Canadian callsigns and it does not contain club calls. A new version of the database is sent around approximately once a year.

There is also an email callsign server at callbook@sat.datapoint.com (The UUCP address is ...!uunet!dptspd!callbook). In the body of the text, say "lookup" followed by callsigns you want to look up. If your mailer appends signature files, you should put a line "quit" at the end of your request (before the signature file). If you want help, put the word "help" on a line by itself. Here is what a request might look like:

```
help
lookup kc1sp wn4bbj
lookup n0fzd
quit
```

If you are a packet radio station, callserver data is available from REQQTH@WA4ONG.VA.USA.NA, subject line should be up to 5 US callsigns, separated by spaces. Body of message is ignored. The server is an OS interface to the MBL packet BBS using the Buckmaster CD-ROM callsign database.

** Where can I find modifications for my radio to extend its capabilities?
There are two ftp servers that has this data:
wsmr-simtel20.army.mil or wuarchive.wustl.edu (BITNET ONLY)
Another FTP site to try is 129.100.22.100.

There is a new server at pcserver@novell.business.uwo.ca. In the body of the email, send the command HELP.

There is a packet radio Mods Server. To get the directories, send a packet as follows:

```
SP REQFIL@N2IMC.NJ.USA.NA
Subject: MODS\Dir.1
/EX
```

To get the mod, send to same place, with Subject MODS\Filename.ext.

REMEMBER that any modification is likely to void your warrantee and that these mods are NOT guaranteed to work.

Subject: FAQs - part 4 of 4

| 30-Jul-91 10:13 dls update, see changebars (|)
The following is a monthly posting of frequently asked questions for
Amateur Radio. Due to the increasing size of this list, I've broken it into
4 Parts (and will break it further if necessary) to keep each Part under
10K bytes.
Part 1 - Beginning Amateur Radio questions
Part 2 - "Where can I find ..." computer questions
Part 3 - Amateur Radio Organizations and Publications
Part 4 - Common Advanced and Technical questions
If you have any questions you think should be added, please email to me at
dls@genrad.com.
This FAQ should ONLY be reposted once a month. If someone asks a question
that is answered by this FAQ, I suggest emailing to that person, or,
alternately, post only the section that answers the question, NOT the entire
FAQ posting. Read news.announce.newusers for proper net etiquette.
|This FAQ is available via anonymous FTP from ftp.cs.buffalo.edu.

FREQUENTLY ASKED QUESTIONS
Part 4 - Common Advanced and Technical questions

Table of Contents:
** What are the different US amateur classes and what can each of them do?
** I'm confused. What do all those abbreviations mean???
** What do all those "tones" mean?
** Where can I learn more about Amateur Radio if I live outside the USA?
** How can I get a "reciprocal license" if I am a licensed ham from another
country?
** My apartment complex does not allow outdoor antennas, now what do I do?

** I got TVI...HELP!!!
** What do you need to get started in packet radio?
** What do I need to get started in satellite communications?
** Did you know that you can get college credit for being a ham?
** On what frequencies does JPL and GSFC retransmit the shuttle audio?

** What are the different US amateur classes and what can each of them do?
Novice - has CW (Morse code) privileges on 4 HF bands (80, 40, 15,
and 10 meter), Voice priveleges on 10 meters, and full priveleges
on 2 VHF/UHF bands (220 MHz and 1290 MHz).
Required are 5 wpm Morse code test and 30-question Novice test.
Technician - has full priveleges on all VHF/UHF bands above 30 MHz.
Required are Novice test and 25-question Tech test.
Technician may access Novice HF bands by passing the 5 wpm Morse
code test.
General - has all Technician priveleges, plus larger access to more
HF bands, including CW and Voice on 160, 80, 40, 30, 20, 17, 15,
12, and 10 meter bands. A General class amateur can give Novice
tests.
Required are 13 wpm Morse code test, Novice, Tech and 25-question
General test.
Advanced - has all General priveleges, plus wider band access on 80,
40, 20, and 15 meter bands. An Advanced class amateur can
also become a VE and give tests to Novice and Tech tests.
Required are 13 wpm Morse code test, Novice, Tech, General and
50-question Advanced test. The Advanced test is the most difficult
of the five written tests.
Amateur Extra - has full privileges on all amateur bands. An Extra
can become a VE and give all amateur tests.
Required are 20 wpm Morse code test, Novice, Tech, General,
Advanced and 40-question Extra test.

** I'm confused. What do all those abbreviations mean???
AM Amplitude Modulation
AMTOR Amateur Teleprinter Over Radio. A more sophisticated version
of RTTY. Also used commercially as SITOR (Simplex Teleprinter
Over Radio).
ATV Amateur Television - a way to see who you're talking to!
CAP Civil Air Patrol is a volunteer organization that searches for
downed aircraft and missing kids and uses frequencies just
outside of the ham bands and often uses modified Amateur radios
CB Citizen's Band radio, this is NOT part of Amateur Radio and
does not require any license to operate
CQ An on-the-air request for a conversation with anyone
FM Frequency Modulation
FieldDay A June activity to practice emergency communications for
24 hours....wives call it 'an exercise in male bonding' :-).
HF High Frequency - 3 MHz to 30 MHz
HT Handy-Talky, a shorthand for "hand held radio"
LF Low Frequency - 30 kHz to 3 MHz

MARS Military Affiliate Radio System, military affiliated Amateurs
who provide free communications for overseas GIs and other
Federal services. MARS operators are licensed under DoD
instead of FCC.
NTS National Traffic System, a way to send radiograms
OM Old Man, refers to any ham, including female hams
packet computer bulletin boards/electronic mail via Amateur Radio
QSO One of the Q signals used in Morse code to mean "conversation"
RTTY Radio Teletype - older form of computer communications on HF
SAREX In Amateur Radio talk, Shuttle Amateur Radio EXperiment, a
chance to talk to astronauts in space. In CAP talk, Search
and Rescue EXercise, practicing for the real thing.
SSB Single Side Band - need less band width than AM or FM
SSTV Like ATV but slower and used on lower bands
UHF Ultra High Frequency - 300 MHz and above
ULF Ultra Low Frequency - 30 Hz to 300 Hz
VHF Very High Frequency - 30 MHz to 300 MHz
VLF Very Low Frequency - 300 Hz to 30 kHz, audio frequencies
YL Young Lady, non-ham girlfriend or female ham
XYL eX-Young Lady, or wife
2m Shorthand for "2 meters", which is a reference to the wave-
length of a common Amateur frequency band used for local
communications

** What do all those "tones" mean?
Sub-Audible Tone: A low tone that you're not supposed to be able to
hear. It's used as a "PL Tone." PL is "Private Line", a trademark
of Motorola for their implementation of CTCSS (Continuous Tone Coded
Squelch System). Basically, the transmitter sends the signal with
the Sub-Audible tone and the receiver only opens when it hears signals
with that tone. Signals without the proper tone are ignored. This
is useful for "closed" repeaters, or for repeaters on the same
frequency that have overlapping geographic areas.
Tone encode refers to the feature of providing the tone on transmit.
Tone decode refers to the feature of responding to the tone on receive.
Tone squelch refers to all of the above. DTMF refers to Dual Tone
Multi-Frequency, or "Touch Tone" which is a trademark of AT&T. DTSS
probably means Dual Tone Squelch System and refers to the feature of
providing a predefined sequence of Touch Tone digits to open the
repeater for transmit. DTSS is an alternate method from CTCSS, which
provides a way to use a "closed" repeater even if your radio doesn't
do Sub-Audible Tones.

** Where can I learn more about Amateur Radio if I live outside the USA?
Write to the ARRL and ask. They can usually tell you how to get a
license in your country.

** How can I get a "reciprocal license" if I am a licensed ham from another
** country?
You need to submit a FCC Form 610-A to the FCC, PO Box 1020,
Gettysburg, PA 17326. They will then send you a reciprocal permit

for alien amateur licensee (FCC Form 610-AL). You must be a citizen of a country with which the United States has arrangements to grant reciprocal operating permits to visiting alien Amateur operators.

** My apartment complex does not allow outdoor antennas, now what do I do?
First of all, don't dispair. Many hams have similar problems. Many books offer advice for the growing group of hams that cannot put up antennas. Some options are:
* Install an "invisible" antenna made of magnet wire.
* Disguise an antenna as a flag pole.
* Install an antenna in the attic.
* ASK the apartment manager. You may find they will let you put up something as long as it "is invisible" or "doesn't disturb your neighbors" or "doesn't attract lightning".
* Operate primarily from your car.

** I got TVI...HELP!!!
Here's some hints on Television interference, but this is not a complete list. There are also books on the subject available from ARRL.
* If cable TV is an underground feed, look for central distribution box. Check for a grounding rod.
* Try installing torroids on the cable TV cable close to the TV, and maybe torroids on the AC cord as well.
* VCRs are notorious for RF leakers, try disconnecting the VCR.
* Check to see if interference is better or worse when cable is disconnected and you use rabbit ears instead. It could be the cable company's problem!
* Calling the cable company may get results, since they are also responsible for RF leakage from their equipment. However, they are very often obstinate. Good luck!
* Try moving the radio antenna further away from the TV sets. Make sure the SWR is LOW.

** What do you need to get started in packet radio?
Packet radio is a digital form of communication using radios. There are OTHER digital forms, as well, like CW, RTTY and AMTOR. To use packet radio, you'll need a radio (2 meters or 1.25 meters is most popular), a box that converts radio signals to digital signals that a computer can understand (called a TNC or terminal node controller) and a computer or terminal. For some computers or TNCs you may need special software as well. However, most TNCs and computers get along quite well with just a terminal emulator software package. Most personal computers can be interfaced to use with packet radio. Since there are many digipeaters, generally even an HT will work with packet radio.

For more information on packet radio, you might try TAPR (Tucson Amateur Packet Radio), PO Box 12925, Tucson, AZ 85732 (602-749-9479).

** What do I need to get started in satellite communications?
For more information about Amateur Satellite Communications, try

AMSAT (Radio Amateur Satellite Corporation), PO Box 27, Washington, DC 20044 (301-589-6062). They also have an international net on Sundays on 14.282 MHz at 1900Z.

** Did you know that you can get college credit for being a ham? It's true! You can receive up to 14 credits in electronics and engineering thru placement tests for CLEP (College Level Entrance Placement) exams and DANTES (Defense Activity for Non-Traditional Educational Support) exams if you have an Advanced or Extra class Amateur license. For more information, ask your campus education office or (for DANTES) your military education office.

** On what frequencies does JPL and GSFC retransmit the shuttle audio?
Station VHF 10m 15m 20m 40m 80m
WA3NAN 147.45 28.650 21.395 14.295 7.185 3.860
W6VIO 224.04 21.280 14.282 7.165 3.840
W6FXN 145.46
| K6MF 145.585 7.165 3.840
All frequencies are in MHz. Use FM on VHF, USB on 10-20m, LSB on 40-80m.
WA3NAN - Goddard Space Flight Center (GSFC), Greenbelt, MD
W6VIO - Jet Propulsion Laboratory (JPL), Pasadena, CA
W6FXN - Los Angeles, CA
K6MF - San Francisco, CA

1597. How I got the FAQs

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-04 02:53:06 UTC
From: kj9u@uhm.ampr.ORG
Message-ID: <8434@uhm.ampr.org>
Source record: 294773

I missed the FAQs on the Unix machine here with readnews, so I tried the uhm.ampr.org gateway machine that I'm sysop of. But the r.r.a.misc message area was overflowed, so I could not easily get the news from there either. So, I sent a note to Diana, asking for an email copy of the FAQs.

Upon dissection of the nearly 600 k text file (the overflow on UHM) I discovered that the expiration dates on her FAQs were the same as their posting times... and of course she just started a 3-week vacation!

So, here they are again. I hope they make it through OK this time.

Aloha,
John Shalamskas, KJ9U
(If kj9u@uhm.ampr.org bounces, try kj9u%uhm.ampr.org@ucsd.edu)

1598. RACES Bulletin #181

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-04 04:45:09 UTC
From: enge@almaden.ibm.com
Message-ID: <9108040444.AA03049@ucsd.edu>
Source record: 294756

From : W6HIR @ WA6NWE.#NOCAL.CA.USA
Msgid : $RACESBUL.181
Subject : RACESBUL.181

TO: ALL EMERGENCY MANAGEMENT AGENCIES/OFFICES VIA THE ARS
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.181 DATE: August 5, 1991
SUBJECT: A COMMUNICATIONS AUXILIARY
Staff personnel in charge of Amateur Radio Auxiliary support groups may have a more useful and flexible group of communicators than they realize. And there may be more "outside" resource groups available to augment your in-house communications during emergencies that strain your system capabilities.
In addition to RACES (Radio Amateur Civil Emergency Service) volunteers, you might find that such organizations as the Civil Air Patrol, the various military MARS organizations, and the ARES (Amateur Radio Emergency Service) can supply experienced and well trained radio communicators. To search out such resources that may be available in your area is an obvious task for your Radio Officer.
All this may seem a difficult and even an unnecessary task for a busy professional to take on, in addition to all the others which make demands on both time and energy. However, it is a truism that no major disaster situation ever happens without overwhelming normally quite adequate communications systems. Professionals in emergency communications organizations may not be aware of the quality people available to them in the Amateur Radio Community. Even though not all Amateurs are interested in being a part of an organized and trained "communications reserve", even a small percentage of the half million licensed Amateur Radio operators in the country can be a formidable group. Likewise, not all Amateurs are physically, psychologically, and technically qualified to fit into an organization that trains for and deals with major disasters. Reserve law enforcement officers and volunteer fire department personnel are usually screened for these roles. Similar selective routines are needed for your "communications reserve" people. Once properly selected and trained, however, your Amateur Radio auxiliary can be equally effective in the communications field as the other - and perhaps better known - police and fire support people.

One more thing to consider - a trained and competent Amateur
may be just what you need to operate some of your own regular
communications gear in an emergency. Given the needed training
in advance, they can be as professional as your regular staff.
Bill Musladin, N6BTJ
Assistant State RACES Officer
EOM

RACES Bulletins are archived at ucsd.edu in hamradio/races

1599. Major Solar Flare Alert - 03 August

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-04 05:37:20 UTC
From: oler@vp.uleth.CA
Message-ID: <0094C973.7D40D540.4701@hg.uleth.ca>
Source record: 294766

-- MAJOR SOLAR FLARE ALERT --

AUGUST 03, 1991

Flare Event Summary
- No Impact Expected -

MAJOR ENERGETIC EVENT SUMMARY

Region 6757 is continuing to produce energetic flare activity. At 22:41 UT on 04 August, this region erupted with a major class M7.4/2N flare. The event began at 22:13 UT, peaked at 22:41 UT and ended at 22:57 UT on 03 August. This event was not associated with any sweeps and was not associated with a tenflare. Radio emissions were not particularly rich. The flare was located at N24W10.

A fairly strong SWF was observed with this event for approximately 20 minutes. Heavy HF absorption was observed over sunlit sectors west of approximately 100 west longitude.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT

A terrestrial impact from this major flare is not expected. However, Region 6757 is continuing to grow and develop. It is retaining a beta-gamma-delta magnetic configuration and could spawn additional major flares. There is a definite threat for another X-class flare from this region over the next 72 hours.

Although no impacts are expected from this last major event, geomagnetic activity should continue at active to minor storm levels over the next 24 to possibly 48 hours. Thereafter, a return to more dormant levels may begin to be observed, barring further energetic solar events.

** End of Alert **

1600. Re: "Standard" 12V Power Connector?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-04 18:26:20 UTC
From: ren@virga.ucar.edu
Message-ID: <12419@ncar.ucar.edu>
Source record: 294679

Hey!, Thanks for doing this subject here. I was looking for a
12v power connector for one of our vhf-fm radios that gets moved
between the operations center (120v converter) and a vehicle
(lighter plug) from time to time. The Radio Shack Molex
p/n 274-222 did the trick (low cost, available. Now let's see
if I got this right... positive(+) on the pointy one, and socket
(female) on the power source inside the male plastic part...
Oh yeah, these are 12 guage wires, and with a little solder
it fits okay.
ren

^^^^^^^^^^^^^^^^

In fact, they have a lot to loose and may not even know it! Texas
has a little know criminal and civil law that makes selling used
or damaged items as new *Illegal*. If this incident is true (and
can be proven in court) they could be subject to criminal charges
and, under the civil law, they would *automatically* be required
to pay three times the value of the item as damages. Even the
Judge cannot reduce the damages below the 3X the value because it
is part of the civil statute. I once used this law to get a car
dealer to buy back a car that had been damaged in transit (then
repaired and sold as new). The 3X damages requirement really woke
them up!

Gene Kennedy - Ham Radio Operator, N5ABI -

>In article <997@compnect.UUCP> daveh@compnect.UUCP (Dave Hultberg) writes:
>>
>>IF R=50 ohms, then a VSWR=1:1 would indicate resonance. BUT, what if
>>X=25 ohms and R=25 ohms. You would still have a 1:1 VSWR as seen by the
>>transmitter, but the antenna would not be resonant. The common dipole,
>>for example is not a perfect match for 50 ohm coax. If you prune a
>>dipole to exactly a 1:1 VSWR, it will be slightly off the resonant
>>frequency.
>

The definition of resonance is when XL = -XC (ie the inductive reactance
cancels the capacitive reactance.). So the impedance of the resonant
circuit is only resistive. (Q of the circuit is Rp/Xl)

To achieve a perfect match (i.e. maximum power transfer)
you require a conjegate match. This is when the source reactance is the
opposite to the load reactance (Xs = -Xl) and the source resistance
equals the load resistance.

To achieve a 1:1 VSWR ON THE CABLE (lossless) you require the load to be
the complex conj. of the cable impedance. (50 ohm for a 50 ohm cable).
You can transform the impedance that you see from the cable at the
generator end to resonance but the VSWR on the cable will still not
be 1:1 if the load has an impedance different to the characteristic
impedance of the cable.

So you would have to cancel the X=25ohms with some capacitive reactance
(admittance) and transform your remaining 25 ohms (resistive) to 50 ohms
resistive to achieve a 50 ohm match. The VSWR on the line would not,
of course, be 1:1 unless the match is done at the antenna end.

>
> It is true that a "resonant" dipole is actually not what gives us
>a resistive load at the end of the transmission line. A truly "resonant"
>dipole is, I think, slightly capacitive due to it's inductive coupling to free
>space (or something like that). So we cut our antennas short to be have a
>reactive component of the opposite sign so as to cancel out the reactive part
>of a "naturally resonant" dipole.

If the antenna is resonant then it will not present an inductive component
by definition. The dipole will not be a true half wave because of the
"end effect". ie. Displacement current flows off the end of the elements.

At resonance the half wave dipole (then half wave over a perfect ground
looks like a 72 ohm resistance at resonanace. (this being the radiation

resistance) This to achieve a perfect match we need to feed it with
a cable with this Zo.
Also the two elements require a balanced current for this to be true,
so either a balanced line or baun is required.

BTW if you dont have a vector network analyser, a good noise bridge
is the next best thing. The only thing an SWR meter will tell you is
whether youv'e got it right or wrong, not which way you need to go!

| >riff-raff to talk to than some few and far between cliquish techno-nerds,
| >I think. This ain't L.A. There's more inactive mountain top repeaters
| >than active hams at any given moment.
|
| Sir, is the term "cliquish techno-nerds" a phrase used to describe anyone
| discussing something that you don't understand?
+---------------

...then again, it's a dead ringer for some fairly impolite hams I've had the misfortune to run in to.

Then again, the *real* experimenters locally are on a wide-open linked system and welcome newcomers.

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

I have heard that the Goddard (NASA) Amateur Radio Club re-transmits shuttle transmissions, presumably on amateur frequencies. I am looking for information (specifically frequency information, though other information is certainly welcome) concerning these retransmissions or any others like it. Thanks in advance for any info.

1606. Minor Geomagnetic Storm Update - 05 August

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-05 02:11:56 UTC
From: oler@vp.uleth.CA
Message-ID: <0094CA1F.F6069300.5044@hg.uleth.ca>
Source record: 294686

/\

GEOMAGNETIC STORM UPDATE

UPDATED: 01:30 UT, 05 AUGUST

/\

STORM UPDATE INFORMATION:

Geomagnetic storming is continuing in progress at the present time. Storming has remained confined to the minor storm levels over most middle latitudes. Periods of major storming have been observed over the high latitudes.

Several periods of auroral storming were observed during the local evening hours of 03/04 August over the northerly middle and high latitude regions. Equatorward expansion of the auroral oval has occurred over the last several days, although the intensity of the activity has not been sufficient to produce wide-spread opportunities for viewing auroral activity over the central and southerly middle latitudes. Some central middle latitudes could witness low to moderate levels of auroral activity over the next 24 hours, although general conditions are expected to begin to subside by 06 August. Australian and New Zealand activity appears to be dominating. Numerous reports of auroral activity ranging from diffuse glows to pink and white rays have been reported from these regions. We expect activity to continue at these levels over the Australian and New Zealand areas for approximately the next 12 to 24 hours. Conditions should then gradually subside. Lunar phase is becomming less of an influence. Generally good observing conditions can be expected after evening twilight and prior to moonrise. We do not expect auroral activity to become intense enough to warrant a Low Latitude Auroral Activity Watch. However, a risk continues to exist as long as solar Region 6757 continues to produce energetic major flares.

Conditions should begin to subside late in the UT day of 05 August or on 06 August. There is only a slight chance for a terrestrial impact on 06 August from the last major class M7.4/2N flare of 03 August. We presently do not expect anything from this flare event.

HF propagation conditions have been below normal over most regions. Geomagnetic and auroral storming over the higher latitudes has produced significantly higher noise and static levels over these regions, which has spread slightly equatorward into some middle latitude regions. Transatlantic communications (ex. between the U.S. or Canada and Europe) have been poor to very poor over the last several days. A gradual improvement in long-distance propagation conditions is expected to begin on 06 August, barring further

major flaring. Until then, propagation conditions will continue to be below normal and somewhat unstable over many low and middle latitude regions.

There will be a fairly substantial threat for a moderate to high intensity short wave fade (SWF) associated with a major flare over the next 24 to 72 hours. Region 6757 has continued to grow and is maintaining a beta-gamma-delta magnetic configuration. Some fragmentation was observed today in the trailer spot complex although this reorientation is not expected to significantly alter the potential for major flaring from this region. We expect this region to spawn another major flare anytime over the next 24 to 72 hours. An X-class flare is possible, but we presently expect the activity will probably remain confined to the higher M-class levels. These levels are significant enough to produce moderate to strong SWFs over the sunlit sectors.

Watch for future alerts or warnings.

1608. backscatter laser amplification

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-05 03:30:42 UTC
From: grady@well.sf.ca.us
Message-ID: <26528@well.sf.ca.us>
Source record: 294678
Cross-posted to: sci.electronics,rec.radio.amateur.misc

I want to duplicate the experiment of decoding the
modulation of an ordinary house window using the
relected light of an ordinary semiconductor laser.
Basically, I want to reflect my penlight laser off
a nearby house window and catch the backscatter using
a pretty strong pair of binoculars, one exit pupil
replaced with a ccd, photoresistor, or some other
appropriate part.
Presumably the output from this optical detector
will drive a low-noise amplifier that I can
use to drive a A mode amplifier and eventually to
a speaker.
Does anyone have a suggestion for an approriate
part on the order of size of an exit pupil, that
presents a reasonable impedance match to available
LN amplifiers?
Thanks ahead of time!
And if anyone has done this kind of experiment
before, perhaps they could share whatever insight
they gleaned. For example, do I need direct reflection
or can dirt backscatter give me enough reflection to
get a signal from the noise?

1610. APT-Sats: Status AUGUST 03, 1991

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-05 09:52:29 UTC
From: henne@eana.f3.gmd.dbp.de
Message-ID: <5325@gmdzi.gmd.de>
Source record: 294765

Observed at station 50.7 NLat, 7.1 ELon, AUGUST 03, 1991

NOAA-9: APT 137.62 On
NOAA-10: APT 137.50 On
NOAA-11: APT 137.62 On
NOAA-12: APT 137.50 ON
METEOR 3-3: APT 137.30 *OFF*
METEOR 3-4: APT 137.30 *ON* again
METEOR 2-19: APT 137.85 *ON* again
METEOR 2-20: APT 137.85 *OFF*

APT-activity was taken over again after only one month by
METEOR 3-4 from METEOR 3-3 who suffered from what seemed
to be a malfunctioning brightness-control.
Additionally METEOR 2-20 is off now too, METEOR 2-19 is
active instead.

Well, that is something I have been dreaming of. Only the European version should rather have 1200 MHz instead of 220, as the latter is not available for amateur use here... Or how about a quadbander?

I am only worried of one thing. How long does the battery last with four CPUs and three receivers at the same time? :-)

Has anyone out there ever ordered from Ramsey Electronics, Victor NY??

It looks like they have a reasonable entry-level setup advertised in
73 Amateur Radio mag. -- "QRP" CW transmitter and companion All Mode
receiver. Available in 80, 40, 30, or 20 m bands, this looks like
it might be worth investigating. Please let me know experiences with
these folks and this product if any. I will be in the office today and
tomorrow. After that I will be gone until 26th Aug.

1 INTRODUCTION

We at Alinco would like to thank you for purchasing the ALINCO DJ-560T (US Model)/DJ-560E (European Model). Radios and other products made by ALINCO rank as some of the finest in the world. Your DJ-560T/E has been manufactured and tested very carefully at the factory and will give you satisfactory operation for many years. We are confident that you will be very satisfied with your choice of this fine ALINCO radio.

1.1 STANDARD ACCESSORIES

When you unpack your ALINCO transceiver, you will find the standard accessories which include:

1. Ni-Cad Battery Pack (7.2V @ 700mAH).EBP-10N
2. AC Wall Charger for EBP-10N.....EDC-21 (120V) for DJ-560/T
EDC-17 (220/240V) DJ-560/E
3. Belt Clip.....EBC-1
4. Hand Strap
5. Dual Band Rubber Flex Antenna

1.2 OPTIONAL ACCESSORIES

To enhance your DJ-560 radio further, optional accessories
are available. At ALINCO, we strongly recommend that you
purchase appropriate accessories to get full features and
performance from your radio.

1. Ni-Cad Battery Pack (12V @ 700mAH).EBP-12N
2. AC Wall Charger for EBP-12N.....EDC-22 (120V) for DJ-560/T
EDC-18 (220/240V) DJ-560/E
3. Mobile DC Power Cable/Charger
with Noise Filter....EDC-26
w/o.....EDC-13
4. Earphone.....EME-6
5. Earphone/Microphone w PTT.....EME-4
6. Speaker/Microphone.....EMS-2Z
7. Headset with PTT/VOX.....EME-10
8. Leather Case for DJ-560 w EBP-10N..ESC-11

2 SPECIFICATIONS

The specifications outlined for this product are for use in
the amateur bands only. No guarantee or warranty, either
specific or implied, will apply to any function or
specification outside the amateur bands. Individual radios
may experience different performance and/or specification
levels. All specifications and features are subject to
change without notice or obligation.

2.1 GENERAL SPECIFICATIONS

Channel Spacing: 5, 10, 12.5, 20, 25 Khz steps
Memory Channels: 42 Channels (20 VHF, 20 UHF and
Independent Call Channels
Antenna Impedance: 50 Ohms unbalanced
Microphone Input Impedance: 2K Ohms
Signal Type: F3
Power Supply Requirements: 7.2 Volts DC
Dimensions:
Height = 169mm (6.65")
Width = 57mm (2.24")
Depth = 32mm (1.23")
Weight: Approximately 440g (.97lbs)
DTMF: 16 Button Key Pad
Subaudible Tones: Encode and Decode installed

2.2 US (DJ-560T) FREQUENCY COVERAGE

VHF Band: 144.000 - 147.995 Mhz (TX)
130.000 - 173.995 Mhz (RX)
UHF Band: 440.000 - 449.995 Mhz (TX)
400.000 - 519.995 Mhz (RX)

2.3 EUROPEAN (DJ-560E) FREQUENCY COVERAGE

VHF Band: 144.000 - 145.995 Mhz (TX)
130.000 - 173.995 Mhz (RX)
UHF Band: 430.000 - 439.995 Mhz (TX)
400.000 - 519.995 Mhz (RX)

2.4 TRANSMITTER SPECIFICATIONS

Output Power: 2 Watts with Standard EBP-10N Battery
5 Watts with Optional EBP-12N Battery
Modulation System: Variable reactance FM
Max. Freq. Deviation: +/- 5kHz
Spurious Emission: Less than 60db below carrier
Tone Frequency: 67.0 to 250.3 Hz (38 selections)
DJ-560T (Subaudible Encoding Tone)
DJ-560E (1,750 Hz Tone Burst)
Microphone: Electret Condenser
Operating Mode:
Simplex:
Duplex: 5khz steps minimum between 0-9.995 Mhz
from receiver frequency.
DTMF Encoder: Built-in and included as standard
CTCSS Decoder: Built-in and included as standard

2.5 RECEIVER SPECIFICATIONS

Receiver System: Superheterodyne, Dual Conversion
Sensitivity: 12dB SINAD less than - 15dB per microvolt
Intermediate Frequency: VHF - 1st IF 55.05 Mhz
2nd IF 455 Khz
UHF - 1st IF 58.125 Mhz
2nd IF 485 Khz
Audio Power Output: 250 mw (10% Total Harmonic Distortion)
Speaker Impedance: 8 Ohms

3 DESCRIPTIONS

This section will discuss what the function or control is
and how to use it. The sub-sections are broken down into
smaller sections for easy access.

3.1 FRONT PANEL CONTROLS/FUNCTIONS

The following descriptions are those functions necessary to
utilize full functionality of the DJ/560T/E.

(1) LCD DISPLAY PANEL

Refer to Section 3.6 for further details on the LCD display panel.

(2) CONTROL KEYPAD

The control pad includes 16 multi-functional command keys that control and execute various operations for the DJ-560T/E. It also serves as a DTMF keypad.

(3) MICROPHONE

An electret condenser microphone is built in to the front panel. When transmitting, speak directly into the microphone from a distance of approximately 5 inches.

(4) SPEAKER

The speaker is located below the key pad on the front panel. It is rated at 8 ohms and is not in operation when an external speaker is in use.

(5) VHF BAND KEY

Pressing this key allows for operation on the VHF band.

(6) UHF BAND KEY

Pressing this key allows for operation on the UHF band.

(7) MCH KEY

1. Press the "MCH" key to put the Main Band into Memory Channel mode. The letter "M" and a memory channel number (0-19) will appear. The "M" will flash if nothing has been programmed into the displayed memory. Pressing and holding the "MCH" key, the memory channel number will increment quickly one number at a time.

2. Press and hold the "FUNC" key, then press the "MCH" key to decrement the memory channel number. If you continue to hold these keys, the memory channel number will decrement quickly one channel number at a time.

Another way to increment and decrement the memory channel is to use the main tuning knob.

(8) MHZ KEY

1. Press the "MHZ" key once will increase the frequency by 1 Mhz. By holding this key down for more than 1 second will increase the frequency by 1 Mhz at a faster rate. Press any number on the key pad to stop 1 Mhz stepping.

2. Press and hold the "FUNC" key, then press the "MHZ" key once to decrease the frequency by 1 Mhz. By holding these keys down for more than 1 second will decrease the frequency by 1 Mhz at a faster rate. Press any number on

the key pad to stop 1 Mhz stepping.

(9) 100K KEY

1. Press the "100K" key once will increase the frequency by 100 Khz. By holding this key down for more than 1 second will increase the frequency by 100 Khz at a faster rate. Press any number on the key pad to stop 100 Khz stepping.

2. Press the "FUNC" and "100K" key once will decrease the frequency by 100 Khz. By holding these keys down for more than 1 second will decrease the frequency by 100 Khz at a faster rate. Press any number on the key pad to stop 100 Khz stepping.

(10) SQL/BS KEY

SQL is short for the word SQUELCH. Activate this feature as follows:

1. Press and hold the "SQL" key to override the squelch on the band selected. In this mode, weak signals below the squelch threshold may be heard.

BS is short for Battery Saver. The battery saver "BS" feature reduces unnecessary battery drain by alternating between listening and the Battery Saver mode. If there is no operation for a period of about 3 seconds the "BS" mode will listen for a signal for approximately 400 ms then Battery Save for approximately 800 ms. This cycle is repeated continuously. Perform the following to activate or deactivate Battery Save feature.

1. Press and hold the "FUNC" key, then press the "BS" key until the display shows "BS ON". The frequency display will return after 2 seconds.

2. Press and hold the "FUNC" key, then press the "BS" key until the display shows "BS OFF". The frequency display will return after 2 seconds.

(11) PRI/PS KEY

PRI stands for Priority. When the "PRI" key is pressed the priority function is active. Refer to the section PRIORITY for a full description of features and operations.

PS stands for Program Scan. Program Scan permits user boundaries to be programmed and those ranges to be scanned. Refer to section 8 for more information on Scanning.

(12) ARM/MONO KEY

The ARM key is labeled but does not perform any operation on this radio.

MONO disables the sub-band. In other words only one band!

Example: Your listening to the VHF band and you don't want to listen to the sub-band (uhf) at all.

1. Press and hold the "FUNC" key, then press the "MONO" key. The sub-band frequency will disappear and be replaced by three dash marks indicating band is disabled. Repeat this step to activate the sub-band or press the sub-band selector key (VHF or UHF).

(13) LAMP KEY

1. Press the "LAMP" key to illuminate the LCD display. The lamp goes out automatically after five seconds.

2. If you wish for the lamp to remain on, press and hold the "FUNC" key, then press the "LAMP" key.

(14) +/- (SHIFT) KEY

The symbols "+" and "-" are used to indicate shift.

1. Press and hold the "FUNC" key, then press the "+/-" key until the desired shift appears on the LCD display.

The + symbol indicates that the transmitter will apply the offset with the transmitted frequency.

The - symbol indicates that the transmitter will subtract the offset with the transmitted frequency.

Simplex operation is active when neither the + or - symbol is displayed on the LCD display. If "OFF" appears in place of the frequency during transmit, the selected frequency is out-of-band.

(15) OFFSET KEY

Amateur radio repeaters utilize separate transmitter and receiver sections. The transmitter frequency may be offset either above or below the receive frequency according to repeater coordination conventions. The standard offset for the 2 meter band is 600 Khz. Offset for the 70cm band is 5 Mhz. Offset direction varies according to established band plans.

To select a repeater offset frequency, perform the following:

1. Select VFO mode.

2. Press and hold the "FUNC" key, then press the "OFFSET" key. An offset frequency will be displayed on the LCD

display. Refer to section 2.4 on page 16 for factory defaults.

3. Turn the Main Tuning dial to the desired offset. You can also use the "MHz" and "100K" keys to assist in obtaining the offset frequency.

4. Press the Main Band (VHF or UHF key) or "PTT" to complete offset procedure.

DJ-560T DJ-560E

VHF: 600 Khz (0.60) VHF: 600 Khz (0.60)
UHF: 5 Mhz (5.00) UHF: 7.6 Mhz (7.60)

(16) REV KEY

This function reverses the transmit and receive frequencies. The transmit frequency becomes the receive frequency and the receive frequency becomes the transmit frequency. This key is used in conjunction with repeater operation. If the transmit frequency is out of range, the transmitter won't transmit. Please refer to section 10.1 for more information.

(17) A/UP ARROW AND DIAL M KEY

The "A/UP ARROW" key serves many purposes, it:

o Increments frequency one channel step while in VFO
o In VFO mode hold the key down to scan incrementally
o Increments OFFSET while in OFFSET function
o Increments STEP while in STEP function
o Increments tone frequency while in TONE F function

The "DIAL M" key is used for automatic dialing. Refer to section 10.3, 11, 11.1 on page 29 for more information on AUTOMATIC DIALING.

(18) MW KEY

MW stands for Memory Write. This function is used to write/store frequencies and features into a memory channel. Refer to section 6.2.2 for more information.

(19) M.SKIP KEY

This key is used to skip select memory channels during a memory scan.

(20) STEP KEY

The "STEP" function is used to select desired incremental changes of receive/transmit frequencies, in steps of 5, 10, 12.5, 20 or 25khz. Get more information on "GETTING

STARTED" in section 2.4.

1. Select a VFO.

2. Press and hold the "FUNC" key, then press the "STEP" key. The channel step will change each time the "STEP" key is pressed. You can also change the channel step by using the main tuning knob, A/UP ARROW or B/DOWN ARROW keys.

3. Press the Main Band (VHF or UHF) key to set channel step and return to operating frequency.

4. After channel step is set, the receive/transmit frequency will increase or decrease by the value selected when you turn the main tuning knob.

(21) B/DOWN ARROW AND K.L F.L KEY

The "B/DOWN ARROW" key serves many purposes, it:

o Decrements frequency one channel step while in VFO
o In VFO mode hold the key down to scan decrementally
o Decrements OFFSET while in OFFSET function
o Decrements STEP while in STEP function
o Decrements tone frequency while in TONE F function

K.L stands for Key Lock. In the key lock mode, most control and command keys are locked and don't function. F.L stands for Frequency Lock. In this mode both bands are locked and cannot be altered.

These are useful features to prevent unauthorized functioning while the radio is in unattended monitoring mode. Here's how to use these features.

1. Press and hold the "FUNC" key, then press the "K.L F.L " key. Each time you press the key, you will toggle the field which will be displayed as follows: KL, KL and FL ON, FL OFF.

(22) BEEP BELL KEY

When the BEEP is on, each key pressed will sound a BEEP. The BELL function is a visual indicator that a signal is being received. It is useful when the Tone Squelch or Code Squelch functions are in use.

1. Press and hold the "FUNC" key, then press the "BEEP BELL" key. Each time the "BEEP BELL" key is pressed the display will cycle through BELL (accompanied with an audio symbol), BEEP OFF, BEEP ON functions. Make a selection and continue.

2. Press a main band (VHF or UHF) key, or PTT to store selection and return to the frequency display.

The BELL function may be set and activated on both bands at the same time. The BEEP will sound only if the BEEP function is on.

(23) TMS VCS KEY

This key is used to select 1 of 3 scan modes. Refer to section 9 for more information on TMS.

(24) APO KEY

This key is used to Automatically Power Off the radio. The APO function prevents inadvertent waste of battery power when the radio is left ON unintentionally. Here's how to use it.

1. Press and hold the "FUNC" key, then press the "APO" key. The display will indicate current setting.

2. Press the "APO" key again to toggle the LCD display from "APO ON" to "APO OFF". If "APO ON" is selected, it becomes active immediately. After about 30 minutes of no activity, a beep is emitted and the LCD display becomes blank. Battery power has now been removed from the radio. To reinitialize APO, turn the radio off and back on again.

3. To cancel APO, press and hold the "FUNC" key, then press the "APO" key again until "APO OFF" appears on the LCD.

(25) ABX/PTT.L KEY

When the Automatic Band Exchange (ABX) function is active, the band that detects the presence of a signal becomes the Main Band.If both bands are quiet, the first band to receive a signal becomes the main band. If the main band is active it remains the main band even if the sub-band becomes active. The transmitter will function on whichever band is the main band when the PTT switch is pressed.

1. Press the ABX key for more then a 1/2 second. Notice how one band indicator remains on while the other band indicator blinks. This means that ABX is active. If ABX key is pressed for less than a 1/2 second the band exchange doesn't become active.

2. Press the ABX key only to disable ABX function.

3. To cancel the ABX function, press the ABX key again.

In the PTT.L (PTT LOCK) mode the PTT switch is disabled. Unintentional transmitting is prevented in this mode. Perform the following to lock the Push to Talk (PTT) key.

1. Press and hold the "FUNC" key, then press the "PTT.L" key. The PTT.L symbol will appear in the LCD display. Press the "PTT.L" key again to unlock the PTT key. The PTT.L symbol will not be displayed on the LCD.

(26) D.SQL/DSQ SET KEY

These keys are used in conjunction with DTMF squelch control. Get more information on DSQ in section 12.

(27) P G KEY

This key is used in conjunction with DTMF squelch control. Get more information on the "P G" key in section 12.

(28) T.SQL/TONE F KEY

The Tone Encoder and Tone (Decoder) Squelch function is standard on the DJ-560T/E. Tone Encode and Decode work on the main band only. The DJ-560T/E has 38 settings from 67.0 khz to 250.3 khz. Utilize the "TONE F" key to access these settings. Access to an increasing number of repeaters is restricted by requiring that a sub-audible tone be transmitted with the input signal to open the repeater. To select the needed tone, perform the following:

1. Press and hold the "FUNC" key, then press the "TONE F" key. A tone frequency will appear in the LCD display.

2. Rotate the main tuning dial or either the "UP ARROW" or "DOWN ARROW" key to the desired tone frequency.

3. Press either the "VHF" or "UHF" key to return to the main band.

The tone frequency is now stored and will be transmitted with the repeater input frequency. Tone operation is discussed further in section 10.3 located on page 28.

Sub-Audible Tone Chart
======================================
67.0 71.9 74.4 77.0 79.7 82.5
85.4 88.5 91.5 94.8 97.4 100.0
103.5 107.2 110.9 114.8 118.8 123.0
127.3 131.8 136.5 141.3 146.2 151.4
156.7 162.2 167.9 173.8 179.9 186.2
192.8 203.5 210.7 218.1 225.7 233.6
241.8 250.3

(29) CALL/CALL.W KEY

Each band has 1 Call channel which is immediately accessible by pressing the "CALL" key. An often used frequency of interest such as a preferred local repeater, is usually programmed into the Call channel. Refer to

section 6.3 on page 20 for more information.

3.2 TOP PANEL CONTROLS/FUNCTIONS

(1) BNC Antenna Connector

You should attach a suitable Dual-Band antenna that will yield a low SWR. The antenna connected should satisfy both the 2 meter and 70 cm (440Mhz) band.

(2) VHF VOLUME CONTROL

Adjusts the VHF audio level. Rotate control clockwise to increase volume , and counter clockwise to decrease.

(3) VHF SQUELCH

Start by turning the knob fully counter clockwise, then rotate the knob back clockwise until background noise is silent.

(4) POWER ON/OFF AND UHF VOLUME CONTROL

Power is not applied to the radio when the POWER knob is fully counter clockwise. When the POWER knob is rotated clockwise, power is applied to the radio and volume for the UHF band may be adjusted.

(5) UHF SQUELCH

Start by turning the knob fully counter clockwise, then rotate the knob back clockwise until background noise is silent.

(6) MAIN TUNING DIAL

Press the VHF or UHF key to select the main band. The main tuning dial/knob may be rotated in either direction to select transmit and receive frequencies, frequency steps, sub-audible tones and transmit frequency offsets.

If the FUNC key is pressed and held, an "F" will appear on the LCD display. The frequency will increase/decrease by one MHz depending on the direction of the tuning knob rotation.

(7) SPEAKER JACK

An external speaker rated at 8 ohms may be plugged into this jack. The built-in speaker is disabled when an external speaker is plugged into this jack.

(8) MIC JACK

An external microphone may be plugged into this jack. We would like to suggest some ALINCO optional accessories that

have been tested with this radio:

o EME-4 o EMS-2Z o EME-109

Refer to section 1.1, 1.2 on page 1 for more information.

3.3 LEFT VIEW CONTROLS/FUNCTIONS

The following controls are located on the left side of the radio as viewed with front panel facing the operator.

(1) FUNCTION KEY

Controls access to secondary functions. These secondary functions are those functions printed in green on the front panel. It is necessary to activate the FUNCtion key to access these secondary functions. When the "FUNC" key is pressed the letter "F" will display in the upper left-hand portion of the LCD display. While holding the "FUNC" button, press the desired command key.

(2) PTT SWITCH

Press and hold this button to transmit. While holding the PTT SWITCH you may speak into the microphone.

*** NOTE ***

On the DJ-560E the lower portion of the PTT SWITCH is used to transmit Tone Burst, and the upper button is the PTT SWITCH. On the DJ-560T either button activates PTT SWITCH.

(3) BATTERY LOCK BUTTON

The battery lock button releases the battery from the radio. The battery is keyed in order to avoid the battery from being inserted incorrectly. To attach the battery, position it below the radio and slide battery from left to right until the lock snaps battery into place. To remove battery, push and hold the lock button upwards and slide the battery to the left (from vantage point where radio front panel is facing you).

3.4 RIGHT VIEW CONTROLS/FUNCTIONS

The following controls are located on the right side of the radio as viewed with front panel facing the operator.

(1) VHF/UHF DUAL EXTERNAL SPEAKER JACK

The DJ-560T/E features an external stereo speaker jack that makes accessible the audio supplied from each band (UHF/VHF). When a stereo headset is used, each band is heard separately, in each earphone. Separate external speakers may be plugged into this jack by using a mini dual

stereo adapter plug. Volume from the VHF band will be heard on the Left channel and UHF will be heard on the Right channel.

*** CAUTION ***

Inserting a standard mono plug into this jack will short circuit the UHF channel. USE STEREO PLUGS ONLY!

*** NOTE ***

When this jack is in use, the audio jack located on the top of the radio will be disabled.

(2) DC IN JACK

Utilizing this jack will provide maximum output power. Plug an external 13.8 VDC power source into this jack. Observe correct plug polarity. The EDC-13 or EDC-26 is recommended as optional accessories. Refer to section 1.1, 1.2 on page 1 for additional information on OPTIONAL ACCESSORIES.

3.5 REAR PANEL CONTROLS/FUNCTIONS

(1) TRANSMIT POWER SWITCH

There are two output power settings, "L" for low and "H" for high. The output power varies due to the battery type and is described as follows:

EBP-10N (7.2VDC).....High Power ??? Watts
Low Power ??? Watts

EBP-12N (12VDC).....High Power ??? Watts
Low Power ??? Watts

3.6 LCD DISPLAY DESCRIPTIONS

(1) FUNCTION KEY

Controls access to secondary functions. These secondary functions are those functions printed in green on the command and control function keys. It is necessary to activate the FUNCtion key to access these secondary functions. When the "FUNC" key is pressed, the letter "F" will display in the upper left-hand portion of the LCD display indicating that FUNCTION is active. While holding the "FUNC" button, press the desired command key.

(2) TRANSMITTER SHIFT

The shift selects + or - repeater input frequency, or simplex operation.

(3) DIAL

The telephone symbol appears, the automatic telephone dialer function is activated. In this mode, up to 16 telephone numbers, characters, and letters may be stored and transmitted automatically. Refer to section 10.3, 11, 11.1 for more information.

(4) PTT.L

The "PTT.L" symbol indicates that the PTT switch is locked. The radio will not transmit even if the PTT switch is pressed accidently.

(5) BELL

When the sound symbol appears on the LCD display it means that the bell function is active. In this mode the sound symbol flashes and an audible tone alert sounds when a signal is received.

(6) KL

KL stands for KEY LOCK. When "KL" is displayed, the command and control function keys are locked out. Utilizing this function prevents accidental use of command and control pad keys.

(7) UHF

This symbol indicates that the UHF band has been selected.

(8) DSQ

When "P" or "G" is displayed, DSQ functions are enabled. DSQ stands for DTMF squelch control.

(9) T SQL

Pressing the T SQL key will toggle the letter "T" or "T" "SQL" on the display. When the symbol "T" appears, the Tone encoder is activated. If the "T" and "SQL" appears the Tone encoder and Tone squelch functions are activated.

(10) VHF

This symbol indicates that the VHF band has been selected.

(11) MEMORY CHANNEL

This symbol indicates that the selected band is in memory mode and displays the memory channel number.

(12) FREQUENCY

Receive and transmit frequencies, offset and tone frequencies, channel steps, DSQ codes and dialer memory channel numbers are displayed in this area depending on the selected mode.

(13) S/RF

In receive mode the "S/RF" symbol and (Signal/RF) bars will be displayed to show signal strength. When transmitting occurs, the S/RF bars indicate RF output power.

(14) FREQUENCY DECIMAL POINT

When receive, transmit or offset frequencies are displayed on the LCD, the decimal point divides MHz and KHz.

(15) TONE DECIMAL POINT

When the Tone frequency is displayed, the decimal point divides Hz and 0.1 Hz.

(16) FULL

The symbol "FULL" will appear when either the received signal or transmitter power output are at their maximum.

*** NOTE ***

You may verify all display segments by pressing the "FUNC" and "PTT" key while turning the power on knob.

Two segments display on radio LCD but have no function on the DJ-560T/E. They are "AIR" (Airband) and "D." for ?????.

4 GETTING STARTED (Receiving)

1. Adjust the following switches and controls on the top of the radio.

o POWER/UHF KNOB: OFF
o VOLUME CONTROLS: Fully Counter Clockwise
o SQUELCH CONTROLS: Fully Counter Clockwise

2. Connect a battery or external 13.8 Volt DC Power Supply to the radio.

3. Connect an antenna with the appropriate antenna connector to the top of the radios. The type of antenna fitting that is expected is a BNC type.

4. When the POWER knob is rotated clockwise, power is applied to the radio and volume for the UHF band may be adjusted. The display should be illuminated and indicate frequencies for VHF and UHF. The initial factory delivered settings are:

VHF

VFO Frequency: 145.000 Mhz DTMF Squelch: None
Memory Channel: 1 Memory Frequency: Empty
Channel Step(560T): 5 khz Scan Type: Busy Scan
Channel Step(560E): 12.5 Khz DSQ Setting: None

Shift: None Call Frequency: 145.000 Mhz
Offset Frequency: 0.6 Mhz Tone Setting: None
Tone Frequency: 88.5 Hz

UHF

VFO Freq. 560T: 445.000 Mhz DTMF Squelch: None
VFO Freq. 560E: 433.000 Mhz Memory Frequency: Empty
Memory Channel: 1 Scan Type: Busy Scan
Channel Step(560T): 5 khz DSQ Setting: None
Channel Step(560E): 12.5 khz Call Freq.(560T): 445.000 Mhz
Shift: None Call Freq.(560E): 433.000 Mhz
Offset Freq.(560T): 5 Mhz Offset Freq.(560E): 7.6 Mhz
Tone Setting: None Tone Frequency: 88.5 Hz

5. Adjust the volume controls on each band until a signal (or noise) is heard.

6. Rotate the Main tuning dial, and select an open frequency on each band. Rotate the squelch controls clockwise on each band until the noise disappears and the S/RF indicator doesn't illuminate.

7. Select the desired band by pressing the VHF or UHF buttons. The VHF symbol will be displayed when VHF is enabled and UHF will be displayed when UHF is enabled.

*** NOTE ***

If external power source is connected, be sure to power off the radio before turning off the power supply.

4.1 FREQUENCY STEP

The "STEP" function is used to select desired incremental changes of receive/transmit frequencies, in steps of 5,10,12.5, 20 or 25khz. Use this feature as follows:

1. Select a VFO.

2. Press and hold the "FUNC" key, then press the "STEP" key. The channel step will change each time the "STEP" key is pressed. You can also change the channel step by using the main tuning knob, A/UP ARROW or B/DOWN ARROW keys.

3. Press the Main Band (VHF or UHF) key to set channel step and return to operating frequency.

4. After channel step is set, the receive/transmit frequency will increase or decrease by the value selected when you turn the main tuning knob.

4.2 KEYPAD ENTRY

When frequency is selected by key pad direct entry, numbers will appear on the LCD display as they are entered on the key pad.

1. Select a desired band by pressing either the VHF or UHF key.

2. Begin by entering the 100 MHz digit. Upon entering the first digit, the band indicator (VHF or UHF) will begin to flash.

3. Enter the 10 Mhz digit.

4. Enter the 1 MHz digit.

5. Enter the 100 KHz digit.

6. Enter the 10 KHz digit. If the radio is in 10 KHz or higher step, a beep will sound and the band indicator will stop flashing.

7. Enter the 5 KHz digit if the radio is set for 5 KHZ step.

4.3 CLEARING ENTRY

To clear an error during key pad entry, you may:

o Press the VHF or UHF band key.
o Press the PTT key.

5 TRANSMITTING

1. Make sure that you follow all steps set forth in the "GETTING READY" section (Section 4) first.

2. Select a frequency, shift direction, shift value, and PL tone frequency.

3. Check to see if the frequency is in use before transmitting.

4. Select appropriate transmitter output level by the switch located on the rear panel of the radio.

5. Press the PTT switch and speak approximately 5" from the microphone, located on the front of the radio.

5.1 POWER OUTPUT SETTING

There are two power settings on the DJ-560T/E. You may select either High (H) or Low (L) from a switch located on the rear of the radio.

*** WARNING ***

It is possible to cause UHF receive interference while transmitting on VHF. To avoid this from happening, make sure that the VHF frequency x 3 does not equal the frequency on UHF. For example, if VHF transmit frequency is 146.190 the UHF frequency should not be set at 438.570.

5.2 TONE BURST (DJ-560E ONLY)

Many European repeaters require a 1,750 Hz tone burst to access a repeater. To transmit a tone burst press the tone burst button.

6 TRANSCEIVER MODES

The DJ-560T/E has 3 modes; VFO mode, Memory mode and Call mode.

6.1 VFO MODE (Variable Frequency Oscillator)

Press either the VHF or UHF key on the front panel. The transceiver will be in VFO mode. This mode is used to change frequency and select the desired channel step, offset frequency (up to 10.995 MHz by 5 KHz), tone frequency (38 frequencies in Hz),etc.

6.2 MEMORY MODE

The following guidelines will help you to program and manipulate memory channels. To select the memory mode, press the "MR" key. The most recently used memory channel will display :

o Frequency
o Memory channel number
o Other programmed functions

You can scan the memory channels with the "MCH" key held down, elect to skip any memory channel with the "M.SKIP" key, or select the scan type with the "TMS VCS" key. Refer to the section SCANNING FUNCTIONS (Section 8) for more information.

The DJ-560T/E has two (02) banks of memory channels:

1ST the VHF bank has 20 memory channels that are accessed with the "MCH" key.

2ND the UHF bank has 20 memory channels that are accessed with the "MCH" key.

6.2.1 SCROLL MEMORY

Scrolling the VHF or UHF bank of memory channels up or down can be accomplished 1 of 2 ways.

MCH KEY

1. Press the "MCH" key to put the Main Band into Memory Channel mode. The letter "M" and a memory channel number (0-19) will appear. The "M" will flash if nothing has been programmed into the displayed memory. Pressing and holding the "MCH" key, the memory channel number will increment quickly one number at a time.

2. Press and hold the "FUNC" key, then press the "MCH" key will decrement the memory channel number. If you continue to hold these keys, the memory channel number will decrement quickly one number at a time.

Another way to increment and decrement the memory channel is to use the main tuning knob.

6.2.2 PROGRAMMING A MEMORY CHANNEL (MW KEY)

To write functions to any memory channel, it is necessary to first set those functions in the VFO mode.

o Select VFO mode (VHF or UHF band).
o Select the receive frequency.
o Select the repeater shift - or +
o Select the required offset. Consult your Repeater Directory.
o Select the proper PL [CTCSS] subaudible tone "T". Consult your Repeater Directory.
o Select Tone Squelch (Decoder) "T SQL".
o Select Tone Frequency

After selecting and setting the required functions you can write (store) those functions to a memory channel as follows:

1. Select VFO mode.

2. Select a frequency, shift direction, shift value, PL subaudible tone, Tone squelch and Tone frequency.

3. Press the "MCH" key. The "M" memory indicator and channel number will be displayed on the LCD. If "M" is flashing, it means that this channel number has no information stored.

4. Turn the Main Tuning Dial clockwise to choose the desired memory channel number (clockwise to increase, counter clockwise to decrease). Select the desired memory channel number (0 to 19).

5. When you have selected the memory channel you want, press and hold the "FUNC" key along with the "MW" key to write (store) to memory.

6.3 CALL MODE

The CALL mode allows a single key to access an immediately desired programmed frequency. Each band has one Call Channel which can be accessed by pressing the CALL key. A

preferred local repeater is usually programmed into the
Call Channel.

6.3.1 PROGRAMMING THE CALL CHANNEL (CALL.W)

To write functions to a CALL Channel, it is necessary to
first set those functions in the VFO mode.

o Select VFO mode (VHF or UHF band).
o Select the receive frequency.
o Select the repeater shift - or +
o Select the required offset. Consult your Repeater Directory.
o Select the proper PL [CTCSS] subaudible tone "T". Consult
your Repeater Directory.
o Select Tone Squelch (Decoder) "T SQL".
o Select Tone Frequency

After selecting and setting the required functions you can
write (store) those functions into a CALL Channel as follows:

1. Select VFO mode.

2. Select a frequency, shift direction, shift value, PL
subaudible tone, Tone squelch and Tone frequency.

3. Press and hold the "FUNC" key.

4. Press the "CALL.W" key to store frequency into the CALL
Memory channel.

6.3.2 ACTIVATING CALL CHANNEL

1. Select VFO mode.

2. Press the CALL key. The CALL indicator "C" will appear on
the LCD display.

3. Press the CALL key again to return to previous mode and
frequency.

*** NOTE ***

Pressing the CALL key for more than 5 seconds will activate
CALL PRIORITY (Dual Watch).

7 PRIORITY FUNCTIONS

The following priority functions are available:

o VFO Priority
o Memory Priority
o Call Priority (Dual Watch)

7.1 VFO PRIORITY

In this mode a VFO frequency is received for 3 seconds and a Memory frequency is received for 1 second in a continuous cycle. Here is how it works:

1. Select VFO mode (UHF or VHF) and VFO frequency.

2. Press the "MCH" key to activate Memory mode.

3. Rotate the Main Tuning Dial to a desired Memory Channel. You may also use the "MCH" up or down arrow to change memory channels.

4. Press the desired VFO (VHF or UHF) key.

5. Press the "PRI" key to begin priority function.

6. Press "PRI" to stop the priority function.

*** NOTE ***

When a signal is received on the memory frequency a BEEP will be omitted from the speaker and the audio indicator will blink for 3 seconds.

7.2 MEMORY PRIORITY

In this mode a Memory frequency is received for 3 seconds and a VFO frequency is received for 1 second in a continuous cycle. Here is how it works:

1. Select VFO mode (UHF or VHF) and VFO frequency.

2. Press the "MCH" key to activate Memory mode.

3. Rotate the Main Tuning Dial to a desired Memory Channel. You may also use the "MCH" up or down arrow to change memory channels.

4. Press the "PRI" key to begin priority function.

5. Press "PRI" to stop the priority function.

*** NOTE ***

When a signal is received on the VFO frequency a BEEP will be omitted from the speaker and the audio indicator will blink for 3 seconds.

In memory priority, the transmitter may be activated on either frequency. Press the PTT switch when the desired frequency is displayed on the LCD.

7.3 CALL PRIORITY (Dual Watch)

The VFO frequency is scanned for approximately 1/2 second and the programmed CALL frequency is scanned for approximately 1/2 second.

1. Select either VHF or UHF as the Main Band.

2. If the CALL channel hasn't been programmed yet, refer to section 6.3.1 on page 20, 21 for more information.

3. Select either VFO or Memory channel mode.

4. Press the "CALL" key for more then 1/2 second. Call priority will begin to cycle between the CALL channel and the selected VFO or memory channel.

5. Press PTT or CALL to cancel CALL priority mode.

8 SCANNING FUNCTIONS

The DJ-560T/E offers various scanning options and 3 scanning modes described a little later on in this section. First lets look at the scanning options, they are:

VFO Scan - Scans either band independently.

Program Band Scan (VFO Mode) - Scans programmed lower to upper frequencies. The bands are independent of each other.

Memory Scan - Each band may scan memory channels independently.

8.1 VFO SCAN

Each band may scan VFO channels independently. When in Band Scan mode the DJ-560T/E scans by Channel step, by 100 Khz or by 1 Mhz steps. As the scan passes through any 500 Khz or 1 Mhz point a tone will sound if the BEEP function is active.

1. Select a VFO and press the "A/UP ARROW" key for approx. 1 second and release key. To scan in the opposite direction press the "FUNC" key and the "B/DOWN ARROW" key.

2. Whether you are cycling upward or downward, during scan the decimal point will flash indicating that scanning has begun.

NOTE

The scan rate is faster if you hold the UP or DOWN ARROW key down. The decimal point will not flash when these keys are held down. Scan frequency will decrease when the main tuning knob is rotated counter clockwise. The same holds true, if the main tuning knob is rotated clockwise the scan frequency will increase.

3. When a signal is received, scanning will stop and remain on that frequency. When channel goes quiet or Main Tuning Knob is rotated clockwise or counter clockwise, scanning will

continue.

4. To cancel scanning press either the "A/UP ARROW" or "B/DOWN ARROW" key.

All 3 scan types can be applied to Band Scan.

8.1.1 PROGRAM BAND SCAN MODE (VFO MODE)

This scan option allows the scanning of a range of VFO frequencies. Each band may have independent scan ranges. The lower band limit is programmed into Memory Channel 18. The upper band limit is programmed into Memory Channel 19. You may initiate Program Band Scan from either VFO or Memory mode.

Storing the Lower and Upper Ranges

Example:

1. Select VFO mode, for example VHF.

2. Select desired Lower Frequency via the key pad like 146.000.

3. Press the "MCH" key.

4. Rotate the Main Tuning Dial until 18 is displayed.

5. Press and hold the "FUNC" key, then press the "MW" key to store the selected Lower Frequency into memory.

6. Select desired Upper Frequency via the key pad like 146.100.

7. Press the "MCH" key.

8. Rotate the Main Tuning Dial until 19 is displayed.

9. Press and hold the "FUNC" key, then press the "MW" key to store the selected Upper Frequency into memory.

10. Press and hold the "FUNC" key, then press the "PS" key. Scanning from 146.000 to 146.100 has started. Press any numerical key or PTT to stop scan.

8.2 MEMORY SCAN MODE

This scan option allows the user to scan frequencies that have been programmed in any (or all) of the memory channels. Bands may be scanned individually or both bands may be scanned simultaneously.

1. Select a VFO and press the "MCH" key for approx. 1 second and release key. To scan in the opposite direction press the "FUNC" key and the "MCH" key.

2. Whether you are cycling upward or downward, during scan the decimal point will flash indicating that scanning has begun.

*** NOTE ***

The scan rate is faster if you hold the UP or DOWN ARROW key down. The decimal point will not flash when these keys are held down. Scan frequency will decrease when the main tuning knob is rotated counter clockwise. The same holds true, if the main tuning knob is rotated clockwise the scan frequency will increase.

3. When a signal is received, scanning will stop and remain on that frequency. When channel goes quiet or Main Tuning Knob is rotated clockwise or counter clockwise, scanning will continue.

4. To cancel Memory Scan press the "MCH" key.

8.2.1 MEMORY CHANNEL SKIP MODE

Memory Channel Skip permits unwanted memory channels to be skipped during memory scan. This step presumes that you have already programmed some/all memory channels.

1. Press the "MCH" key.

2. Rotate the Main Tuning Dial until the memory channel that you want to skip is displayed.

3. Press and hold the "FUNC" key, then press the "M.SKIP" key. The decimal point will disappear from the frequency displayed, indicating this frequency will be skipped. Perform step 2 and 3 for each memory channel that you wish to skip.

4. To cancel Memory Channel Skip, press and hold the "FUNC" key, then press the press the "MCH" key. The decimal point will re-appear, and that memory channel will now be restored to scan status.

9 SCANNING TYPES

The DJ-560T/E offers 3 different scanning modes as shown below. The initial factory setting is the Busy Channel Scan.

Busy Scan - Stops at busy channel or frequency until clear, then resume scan.

Timed Scan - Stops at busy channel or frequency, then resume scan 5 seconds later.

Empty Channel Scan - Ignores busy channels and stops on inactive (empty) channel or frequency.

Selecting a Scan Type:

1. Select the desired Main Band.

2. Press and hold the "FUNC" key, then press the "TMS VCS" key. Each time this key is pressed another scanning mode option will appear.

3. Select the desired scanning mode, then press the desired Main Band key. The Scanning Mode is now set and display returns automatically 2 seconds later.

9.1 OTHER SCANNING INFORMATION

This subsection talks about all other information pertinent to radio scan.

9.1.1 1 MHZ STEP SCANNING

1. Press the "MHZ" key once will increase the frequency by 1 Mhz. By holding this key down for more than 1 second will increase the frequency by 1 Mhz at a faster rate. Press any number on the key pad to stop 1 Mhz stepping.

2. Press and hold the "FUNC" key, then press the "MHZ" key once will decrease the frequency by 1 Mhz. By holding these keys down for more than 1 second will decrease the frequency by 1 Mhz at a faster rate. Press any number on the key pad to stop 1 Mhz stepping.

9.1.2 100 KHZ STEP SCANNING

1. Press the "100K" key once will increase the frequency by 100 Khz. By holding this key down for more than 1 second will increase the frequency by 100 Khz at a faster rate. Press any number on the key pad to stop 100 Khz stepping.

2. Press and hold the "FUNC" key, then press the "100K" key once will decrease the frequency by 100 Khz. By holding these keys down for more than 1 second will decrease the frequency by 100 Khz at a faster rate. Press any number on the key pad to stop 100 Khz stepping.

9.1.3 DUAL BAND SCAN

You may want to scan both bands at the same time. You can perform that function by following this example.

Example: Dual Band Scan

1. Press the VHF key.

2. Press the "A/UP ARROW" key for approx. 1 second.

3. Press the UHF key.

4. Press the "A/UP ARROW" key for approx. 1 second.

9.1.4 SCANNING WITH PRIORITY

If you want to activate PRIORITY on both bands while SCANNING, no problem, follow this example.

Example: Dual Band Scan with Dual Band Priority

1. Press the VHF key.

2. Press the "A/UP ARROW" key for approx. 1 second.

3. Press the "PRI" key.

4. Press the UHF key.

5. Press the "A/UP ARROW" key for approx. 1 second.

6. Press the "PRI" key.

10 REPEATER OPERATIONS

Amateur radio repeaters utilize separate transmitter and receiver sections. The transmitter frequency may be offset either above or below the receive frequency according to repeater coordination conventions.

10.1 REV KEY

In some areas there may be repeaters operating on repeater frequency pairs, the exact reverse of another repeater in the area. That is, the input of one repeater is the output frequency of the other and vice versa. To avoid the inconvenience of reprogramming every time both repeaters are in range, the REV key allows instant reversal of the input and output frequencies and the offset direction. The REV function is also useful to check the repeater input to determine if another station is heard directly so you can go simplex. To activate the REV function:

1. Press and hold the "FUNC" key, then press the "REV" key. The repeater input frequency and opposite SHIFT indicator will appear on the LCD display panel.

2. Press and hold the "FUNC" key, then press the "REV" key again to cancel the REV function.

10.2 RESETTING RADIO

*** NOTE ***

Resetting the radio will erase all user programmed information (frequencies,shifts,offsets etc.) Make sure that this information has been written down before proceeding.

1. Make sure radio is powered off.

2. Press and hold the "FUNC" key in while turning on the radio via the power knob. The LCD will display 145.00 (VHF) and 445.00 (UHF), and you can now access Cross Band Repeat.

10.3 PL ENCODE/DECODE

PL Encoding allows you to select the proper tone frequency to open another operators radio or repeater. PL Decoding enables another operator to select the tone your receiver requires enabling you to hear them. Unlike Code Squelch operation (Refer to section 12.2 for details) A specific tone frequency is used. Here's how to use PL Encoding/ Decoding.

1. Select a VFO.

2. Press the "T.SQL" key. Tone settings will cycle each time the "T.SQL" key is pressed. It cycles as follows on the LCD display:

o Tone Encoder Enabled with the letter "T" displayed on LCD.
o Tone Decoder Squelch with the letter "T" and "SQL" displayed on the LCD.
o When the "T" and/or "SQL" is not displayed, the encoder/decoder is disabled.

11 AUTOPATCH OPERATION (AUTOMATIC DIALER)

The DJ-560T/E offers one automatic dialer channel. The telephone number may be entered in either the VHF or the UHF frequency mode. The stored telephone number is transmitted on whichever band is selected as the main band.

11.1 PROGRAM AUTODIAL NUMBER

To enter a telephone number, perform the following:

1. Press and hold the "FUNC" key, then press the "DIAL M" key. The frequency display will be replaced by 4 dashes. The telephone symbol will display on the LCD and flash, indicating that the dialer memory is ready to accept the number to be stored. You may enter up to 16 numbers, letters and symbols, four at a time in four groups.

*** NOTE ***

After each group of four is entered the second group will replace the first group and so on.

2. The entered telephone number is stored by pressing the desired main band (VHF or UHF) key or PTT switch.

Change the number by repeating the steps 1 & 2 in this section.

11.2 TRANSMIT AUTODIAL NUMBER

After performing the steps in section 10.3, 11, 11.1, perform the following steps to transmit the programmed number.
1. Verify that the telephone symbol appears on the LCD display.

2. Press and hold the "PTT" switch, then press the "FUNC" key to transmit number.

*** HINT ***

If the repeater autopatch requires an entry of an access code as part of the telephone number, enter the code first, then the telephone number. All digits will be transmitted. In some cases you would have to enter the autopatch code manually, then use the dialer.

11.3 MANUAL DIAL

In some instances you may want to dial a number manually. perform the following steps.

1. The telephone symbol should not appear on your display. If it does, press and hold the "FUNC" key, then press the "DIAL M" key, then the "ABX" key.

2. Press and hold the "PTT" key.

3. Now dial the number on your keypad as you would a telephone.

11.4 DISABLE AUTODIAL

1. Press and hold the "FUNC" key, then press the "DIAL M" key, then the "ABX" key. The automatic dialer memory is now empty. The telephone symbol will disappear from the LCD display.

12 HISTORY OF THE DSQ FUNCTION

At the beginning of DSQ implementation, the first handheld radio by ALINCO to offer this functionality was the DJ-160T/E. This radio utilized DSQ in order to make private contact with a single operator or group of operators as deemed necessary, very much like a pager!

The DJ-160T/E original DSQ scheme allowed:

o 3 digits for group code (000 to 999)
o 1 digit for the operators "own" code (0 to 9)
o 1 digit for "other's" to have as a personal code (0 to 9)

As you can see, if you have more then 10 operators (0 to 9) you are out of luck when using private calling.

The next generation would be called "Expanded DSQ". These "Expanded" functions can be found in the DJ-560T/E handheld

and incorporate:

o 3 digits for group code (000 to 999)
o 3 digits for the operators "own" code (000 to 999)
o 3 digits for "other's" to have a personal code (000 to 999)
o 3 digits to monitor an(other's) code

The DJ-560T/E is backward compatible with the DJ-160T/E and is currently utilizing "Expanded DSQ" with other ALINCO products such as the DR-590T/E mobile, other DJ-560T/E's and the DJ-F series. Here is a compatibility matrix that will help you to understand what is compatible with what!

DSQ COMPATIBILITY MATRIX

Radio Type	Original DSQ	Expanded DSQ
DJ-160T/E HANDHELD	Yes	No
DJ-560T/E HANDHELD	Yes	Yes
DR-590T/E MOBILE	No	Yes
DJ-F SERIES HANDHELD	No	Yes

Now that you understand that there was an original DSQ scheme and a newer "Expanded DSQ", we can fully discuss how they are to be used on the DJ-560T/E!

12.1 DSQ ORIGINAL SCHEME

DSQ stands for DTMF Squelch Control. As the original DSQ scheme, it is often used in conjunction with the DJ-160T/E. This is a very powerful feature that will allow you to call a particular individual or group of individuals. This feature is achieved by use of DTMF Tones that will either open (or keep closed) the DJ-560T/E. In Section 16.1, you will begin to understand how the original DSQ scheme works and how to transmit & receive with it!

12.1.1 DSQ "ORIGINAL" CODING

With DSQ paging, you can place a transmission in a variety of ways, as described below.

OPTION 1: 3 DIGIT GROUP CODE

By programming a 3 digit group code your members of a group would receive a common transmission. Perhaps this group wouldn't want to hear a transmission meant for another group that has another 3 digit code sequence.

EXAMPLE:

Lets say that you are helping the local police department find a missing child. They have split 10 radio operators into 2-five person teams. Let's call them team 1 and team 2.

Each member of team 1 has a radio with a group code of 111. Each member of team 2 has a radio with a group code of 222.

The police have just found evidence that the child is definitely located in team 2 territory. The central transmission point now needs to contact the members of team 1 and fill them in on their findings. They will send out a 111 group code (tone sequence) to team 1. By virtue of the group code 111, all members of team 1 will hear the message and team 2 will hear nothing on their radios.

OPTION 2: 1 DIGIT PRIVATE "OWN" CODE

A single digit personal code would be utilized by an individual operator who would receive a private call.

EXAMPLE:

Lets say that you will receive some specific information. The other person will need to know your "own" code before your radio will receive a private call. Your "own" code is also necessary, because the other person receiving your message will see your "own" code displayed on their radio LCD.

OPTION 3: 1 DIGIT "OTHERS" CODE

This code is used to call a specific person in a group. It is the other persons "own" code.

EXAMPLE:

Lets say that an individual in team 1 needs to be given some specific information. We will send only that person the information and nobody else in the group. By virtue of their 1 digit "own" code, they will hear only their message.

OPTION 4: 1 DIGIT MONITOR CODE

When your "own" private code is sent to your radio, the "other's" private code can be memorized.

OPTION 5: MISC CODES

16 numbers, letters and symbols can be used for coding. Here's what you can use; 0-9, A-D, * and #. An "H" will appear on the LCD when the * is entered and upside down A will appear when the # is entered. The # sign is used as a wild card. Refer to WILDCARD for more information.

12.1.2 TRANSMITTING (PRIVATE CALLING IN A GROUP)

1. Select which frequency and band you wish to operate on.

2. Press and hold the "FUNC" key, then press the "P G" key until "G" appears on the LCD display.

3. Enter 3 digits for the group that YOU want to call followed by your 1 digit "own" code. In other words your personal ID code from 0 to 9.

EXAMPLE:

The first three digits are the group code, enter 111. The final digit is reserved for your "own" personal code, enter 2. Your display should look like this:

A111.2

4. Press and hold the "FUNC" key, then press the "P G" key until "PG" appears on the LCD display.

5. And now you must select the "others" single digit code. This is the operator you are calling. Lets say your calling operator 3! Enter "3" on the keypad. Notice how this digit is entered into the single digit area above the group code and just right of the band indicator.

6. Press the PTT key to transmit the DSQ code. The following example will illustrate what the tone stream looks like.

EXAMPLE:

The first 3 tones you will hear when you push on the PTT key will be the 3 digit group code (111). This will be followed by the "others" code (3). A delimiter character is sent followed by the last digit which identifies you (your "own" code) (2).

1113*2

12.1.3 RECEIVING (PRIVATE CALL IN A GROUP)

To receive a private call from another operator, setup your radio as follows:

1. Press and hold the "FUNC" key, then press the "P G" key until "PG" appears on the LCD display.

When the received DSQ code matches the first 4 digits of your display (group and own code), the DSQ "PG" indicator will begin to flash. If the "BEEP BELL" is off, the squelch will open for as long as the calling operator is transmitting. If the "BEEP BELL" is on, an audible beep will be emitted from the radio and the beep indicator will flash on the LCD display. Reset the flashing DSQ indicator by pressing the main band key.

The calling operators "own" digit will appear on your display next to the band indicator.

*** NOTE ***

If the received coded signal matches the "P G" pager code, the mode is selected automatically. When the "other's" code is not confirmed, an "E" will be displayed on the LCD instead of "A".

12.1.4 TRANSMITTING (GROUP CALLING)

1. Press and hold the "FUNC" key, then press the "P G" key until "G" appears on the LCD display.

2. Enter the 3 digit group code that YOU want to call followed by your 1 digit "own" code. In other words your personal ID code from 0 to 9.

EXAMPLE:

The first three digits are the group code, enter 111. The final digit is reserved for your "own" personal code, enter 2.

3. Press the Main band key. either VHF or UHF. The DSQ code is now stored and the LCD display will return to the Main Band frequency.

4. Press the PTT key to transmit the DSQ code. The following example will illustrate what the tone stream looks like.

EXAMPLE:

The first 3 tones you will hear when you push on the PTT key will be the 3 digit group code (111). This will be followed by a delimiting character. Immediately afterwards the digit which identifies you (your "own" code) will be sent (2). The entire sequence will end with 2 delimiting characters.

111*2**

12.1.5 RECEIVING (GROUP CALL)

To receive a group call from another operator, setup your radio as follows:

1. Press and hold the "FUNC" key, then press the "P G" key until "G" appears on the LCD display.

When the received DSQ code matches the first 3 digits of your display (group code), the DSQ "G" indicator will begin to flash. If the "BEEP BELL" is off, the squelch will open for as long as the calling operator is transmitting. If the "BEEP BELL" is on, an audible beep will be emitted from the radio and the beep indicator will flash on the LED display. Reset the flashing DSQ indicator by pressing the main band key or PTT.

The calling operators "own" digit will appear on your display next to the band indicator.

12.2 CODE SQUELCH

Well you might have decided that the "Original DSQ" function is not your cup of tea. Thats ok, maybe individual code squelch is more to your liking. This is different from Tone Encoding/Decoding (Refer to section 10.3). This gives you a choice to select your own 3 digit code, and only the person who knows your code will open your receiver. Here's how it should be used.

1. Select an operating frequency.

Example: Enter the 2 meter frequency of 146.520.

2. Press and hold the "FUNC" key, then press the "DSQ SET" key several times. Notice how you can scroll through A,B,C & D! These are the 4 DSQ memory channels. Each memory channel is very much like a mailbox. Each mailbox will hold 3 letters (digits). These digits represent your personal code squelch identification.

Example: Select code squelch memory channel "A".

3. Release the "FUNC" key now and select a 3 digit code squelch code using the keypad.

Example: Enter the 3 digit code 333.

4. Press the "FUNC" key to return the LCD display to operating frequency.

Example: Now you will see on the LCD display P45.52.

5. Press the "D.SQL" key repeatedly (2 times) until "C" appears in the 100 Mhz digit location.

Example: C45.620 or C46.000

6. Press the "PTT" to transmit the code squelch code with the transmitted signal.

*** NOTE ***

If the received code squelch signal matches the set code squelch code, a "C" will appear on the LCD, squelch will open and incoming signal will be received.

12.3 DSQ WILDCARDS

The "#" symbol is a wildcard that may be substituted for any one digit,letter or symbols used in DSQ codes. When the "#" symbol is entered it appears on the LCD display as an upside down A. The wildcard allows for the combination of many groups. If the first or first and second digits of

several group codes are the same, you can replace the second and third digits (or just third digit) with a "#" mark, and thus transmit to all those groups.

Example:

1. Enter the 2 meter frequency of 146.520.

2. Press and hold the "FUNC" key, then press the "DSQ SET" key. Select any code squelch memory channel.

3. Release the "FUNC" key now and select a 3 digit code squelch code using the keypad.

Example: Enter the 3 digit code 1#5.

4. Press the "FUNC" key to return the LCD display to operating frequency.

Example: Now you will see on the LCD display P45.52.

5. Press the "D.SQL" key repeatedly (2 times) until "C" appears in the 100 Mhz digit location. If you want to see on your LCD display which group code is calling you, refer to the HINT on page 37.

Example: C45.620

If the incoming coded calls are anyone with a group code as follows, the call will be received by your radio.

o 105 through 195
o 1A5 through 1D5
o 1*5
o 1#5

6. When you receive a call from another station, the "C" will flash on and off for as long as the other operator is transmitting. Your radio has already memorized who was calling you, so press the "PTT" key and you will transmit to that station directly. When you have completed your QSO, enter the wildcard sequence again to open your radio to all other stations again.

*** HINT ***

If you want to see who was calling you, perform steps 1-6 in section 12.3. After step 5 press and hold the "FUNC" key, then press the "DSQ SET" key. When you receive the call, their group code will appear on the LCD display immediately.

1614. Alinco DJ-160 DTMF Decode (New)

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-05 13:49:32 UTC
From: sdkuo@argo.acs.oakland.edu
Message-ID: <8689@vela.acs.oakland.edu>
Source record: 294691

For those of you with Alinco DJ-160s, here is how the DTMF decode works:

1) Select frequency to monitor
2) Select DSQ mode
OR
Enter anything in Dial Memory 1 or 2, such that the DIAL indicator
comes on (if the DIAL indicator is on already, then you're all set)
3) When a DTMF code(s) is received, it will be stored in Dial Memory 3,
use DIAL CH to view it

Note that when DSQ mode is selected, no audio will be heard. The second
method is much better as you will hear all audio.
I haven't found a way to clear Dial Memory 3, whenever a new series of
tones are received, they over write the old ones.

I took my Tech plus code from an ARRL VEC on June 8.
ARRL mailed the 610 to Gettysburg on June 26.
License was issued effective July 30, I received in August 3.
Yet another exactly 8 week data point.
Two novices (paperwork sent directly to FCC) got their
tickets in 4 weeks. From these three, looks like Gettysburg
is moderately consistent about 4 weeks of processing time.

Now all I have to do is upgrade and hope for a little more
easily understood callsign - K Dee 4 Dee Eee Zee - it just
the sort of callsign that the phonetic representation was made for.

1616. re:steve - W3GRG on Texas Towers comments

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-05 14:48:08 UTC
From: Wayne_A_Lightsey.Roch809_XBS@xerox.com
Message-ID: <".5-Aug-91.10:48:08.EDT".*.Wayne_A_Lightsey.Roch809_XBS@Xerox.com>
Source record: 294693

Steve says: ..."I am delighted to see the good and the bad comments here about dealers. I just wish there were ways to spread these messages farther. There's no reinforcement of customer satisfaction like increased or decreased sales. Unfortunately, I suspect the internet reaches a very small and esoteric portion of the ham radio community."

Steve, it is a well established marketing axiom that a dissatisfied customer will tell 11 people whereas a satisfied customer will only tell 3!

I would almost guarantee you that the adverse publicity Texas Towers has received here will show up in their sales. It may be that they will never know why because no one will tell them of the bad things said here.

On the other hand, Austin Radio, which just recently received good endorsements will probably never see a significant positive shift in their sales due to the recommendations made here. It may not be fair, but that's the way it works in the real world.

Maybe I live in a unique part of the ham world, but a whole lot of hams around here have access to info-hams directly. Info-ham items occasionally show up in club newsletters also. There is also a lot of commonality between items contained in this forum and traffic existing on the packet radio BBS circuit - I don't know which feeds which. Altogether, I suspect Texas Towers got a big black eye!

> - Brian

The Molex 1545 connectors are available from Radio Shack, which has
retail stores in virtually every community in the USA, has an export
division for foreign orders (as well as having stores outside the USA),
accepts mail, and phone (FAX from certain stores), and takes credit
cards in payment (as well as offering its own credit). There is no
minimum for store purchases, and the Molex 1545 is packaged as RS#
274-222 for 99 cents (includes one male, and one female).

They are even cheaper from any of a host of electronics suppliers.

1621. New Advance Class Operator thanks all for their help

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-05 16:46:00 UTC
From: nmr1248@ariel.lerc.nasa.gov
Message-ID: <5AUG199112462643@ariel.lerc.nasa.gov>
Source record: 294696

Hello,

About two months ago I posted a message here asking people what
method they used to help them remember the harder (or less used)
letters of the alphabet, i.e. B, F, J, L, Q, Z. At that time I had
failed the 13 wpm code because of those letters.

I got many responses and I tried about all of them. As the subject
header can tell you, I not only passed the 13 wpm code, I also
passed element 4A, the Advance Class theory. One thing I did learn
was that I had to be consistent about practicing. I used the ARRL code
tapes and practiced 15-30 minutes every night. I also listened to the
W1AW broadcast about 3 times a week, and I tried copying code 13wpm
and higher. Also, the code tapes I got from Bob West, WA8YCD, helped
a lot.

At the test site, there was three of us who were planning on taking
the 13 wpm code. Since someone else was going for 20 wpm, the VEs
recommended that we try 20 wpm. I got 6 out of the 10 questions correct
and missed passing the code by 1 question. You can bet that I was amazed!!
I didn't have a solid 1 minute copy but from what I was able to copy,
I was able to guess correctly at most at the questions. I plan on trying
for both the Extra theory and code (element 1C and 4B) in two weeks.

Again, thank you to everyone for your help and encouragement.

Ah Steve, you don't understand -- the poster who requested the
information wanted you to do his research for him, mail it to
him as he can't be bothered to follow up on his own question,
and then not be bothered by the fact that he was going to use
the data you supplied in an article under his byline.

As far as availability of information goes, a quick check of
the books available in the ads of any current amateur, scanner,
or even "popular" electronics mag will give anyone a good list
to start from. Not to mention the card catalog at any decent
public library.

1624. Radio Mods

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-05 17:58:02 UTC
From: georgez@synopsys.com
Message-ID: <302@synopsys.COM>
Source record: 294699

In response to my posting of last week regarding the radio mods
info, I have the following information:

PCSERVER -- An email server for MS-DOS.

Available Commands:
==========

SENDME <filename> Requests a file from the server.
SENDME <filename> $HEX Requests a file and the server will send it as Hex.

GET <filename> Same as SENDME.

DIR <options> Sends a list of files in the current directory.
DIR *.* DIR *.EXE DIR *.MOD

CD <options> Changes the default directory.

VERSION Displays the current version of PCSERVER with some
statistics on the installation and use.

All commands must start at the first position on the line. The server ignores
the subject line in the header of the message. Only commands in the body of
the message will be considered.

Example:

If you wanted to request the file called TS440.MOD from the MODS directory,
you would send the following commands in your mail message:

CD MODS
SENDME TS440.MOD

This will cause two mail messages to be generated. The first message would
notify you that the "CD MODS" was taken ok; the second message would contain
the file TS440.MOD.

The files are also available through anonymous FTP to 129.100.22.100

Any questions can be directed to:

Mark Bramwell,
The University of Western Ontario
School of Business Administration,

mbramwel@novell.business.uwo.ca

Well, thats all for now, I hope you all find this usefil...

Thanks for your interest and help.

It is not a problem. Exposure to only 10 minutes of sunshine a day
allows the built-in solar cell (exposed through the display) to
recharge the battery for a full day of operation.

Or does this requirement disqualify it for European operation? :-)

1843eip@hickam-emh.af.mil (1843rd EI Group) writes:

[lots of my comments deleted]

>So worst case, we're looking at about 11-12 weeks...but I got a note from
>another recent Advanced upgrade who got his ticket back in 5 weeks. He didn't
>say which VEC, though.
>
>Guess I'll just sit tight for another couple of weeks...

Unfortunately, that's about all you can do. We recommend waiting at least 60 days minimum and 90 if you can stand it, before calling the W5YI office about an upgrade. The VE team might have made a mistake on some of their paperwork (and this would delay your application without your knowing it), or the 610 might have been rejected by the FCC for some reason (usually due to a mismatch between the 610's information and their database's information on your name, address, birthdate, license class, etc., usually caused by hard-to-read handwriting), or (worst case) the application COULD have been lost somewhere. In any case, the VE team and W5YI-VEC have enough information to recreate the test session if need be, but there isn't much that can be done to relieve the aggravation of waiting (and waiting, and ...). If you know of someone who took their test at the same session as you did and has their license and you don't, chances are that something was wrong with your 610. If, however, everyone's license is delayed, chances are that the VEs paperwork was in error.

[more of my comments deleted]

>Then if I put in a address change and don't get the new ticket back before
>taking a test, do you also hold the upgrade until the new ticket arrives, or
>does their restriction apply only to upgrades?

The rule applies to ANY 610 application pending, address changes included.
I guess that's why there's a REASON block on the 610.

>{
>I guess the moral of all this is not to bother taking another test until you
>get yer ticket back from the last upgrade/modification...seems like we're
>taking a few steps backwards here :-(.
>{
>The reason this bothers me, other than the one I originally wrote, is that
>I'm anxious to put in my paperwork to become a VE...

No, there's generally no reason to wait 'cause you can operate with your new privileges immediately (as you know :-)). It's only the requirement that you must have your Extra license in-hand to be a VE that is stopping you here, but that's not a reason for everybody not to upgrade as soon as they're ready.

>The VE team was very specific about the black ink business...I had already
>prepared my 610 in just that manner, but then I'm not known for my penmanship!
>:-)
>
>73,
> Jeff Miller NH6ZW AFA8JM
>
>(Further followups on this should probably go over to the policy group...)

Right. My main reason for posting these replies is that LOTS of people want to know what's happened to their application because it's been n number of days since they took their test and they haven't seen anything (n can be any number, usually well below 60) and I wanted to sorta defend the VEs and VECs. Also, this newsgroup gets lots more reading than .policy does.

BTW, I will happily reply to any other questions anybody might have about VE or VEC operations. I'm not sure who keeps up the list of information sources on this newsgroup, but if you're listening, you might add me to it.

73! -Steve, NS5I

The ARRL Educational Activities Department has several programs to help amateurs (or prosective amateurs) find help getting started. They will be able to help you find an "Elmer" (a hammy term for a ham who is willing to give help to a newcomer) by giving you a list of amateur clubs in your state. Ask for a "State local-club printout". Make sure you specify the state (or states if you live near a state line).

If you are not yet a ham, or would like information about ham radio, ask them for a "New prospect package". There is no charge for either of these services. You do not have to be an ARRL member to obtain help from our Educational Activities Department. Business-size SASE is appreciated.

Write to:

ARRL Headquarters
Educational Activities Department
225 Main St.
Newington, CT 06111

You can email a request to: 2155052@mcimail.com. Please include your postal mail address because the reply will be via the post.

You may contact any ARRL Headquarters department at the address and telephone numbers seen in my signature.

Most of the hams in this area are getting their licenses back in 4 or 5 weeks.
The Charlotte VEC sends the forms to the FCC very soon after the tests
are taken. Since no national clearinghouse is used, the amount of time
saved is considerable. I have never heard of anyone local taking longer
than 5 weeks to get the license.

There have been some W5YI tests up in the Greensboro area that take
about 5 weeks, so it is possible to get fast turnaround if the VE team
sends the paperwork in promptly.

Has anyone ever approached the ARRL ? They're in the publishing business, and a version on CDROM could be profitable. Rusty's 70 hours/year isn't factored into the price. If we paid for the service, even at minimum wage, we'd probably find some volunteers.

We could probably cut mailing costs by standardizing on a higher-density media, like 8mm, QIC, or DAT. Yes, some people would scream. If you're trying to break even, you eliminate the negative-ROI customers first. It would make it much easier on the copiers. Most commercial employees can convert anything to anything, except maybe punched cards.

I like the idea of a club that buys a new FCC tape when its costs are covered. "Costs" though, should include things like labor, media, and postage.

1635. Minor Geomagnetic Storm Update - Shock Arrival - 05 August

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-05 23:06:51 UTC
From: oler@vp.uleth.CA
Message-ID: <0094CACF.45C115A0.5551@hg.uleth.ca>
Source record: 294703

/\

GEOMAGNETIC STORM UPDATE

UPDATED: 22:30 UT, 05 AUGUST

/\

STORM UPDATE INFORMATION:

An interplanetary shock was observed at 2246 UT on 05 August. The source of this shock may have been the major class M7.4/2N flare of 03 August.

Geomagnetic activity stabilized prior to the shock arrival and was generally active. Only brief periods of minor storming were observed over the high latitude regions.

Conditions are expected to destabilize on 06 August. Minor to possibly brief major storming may be observed (particularly over the high latitudes) during the earlier part of 06 August (between 00:00 UT and 15:00 UT). A gradual improvement should take place thereafter with mostly active conditions being observed (except over the high latitudes where minor storming may continue for the next 24 to possibly 48 hours).

Auroral activity is expected to be high over the northerly middle and high latitude regions on the evening of 05/06 August. Central middle latitudes may be able to observe low to moderate levels of activity. There is only a slight chance for low latitude auroral activity on 06 August. We do not anticipate any auroral observations from these latitutes. Australia and New Zealand stand a good chance for observing auroral activity, particularly over the southern regions with a clear view of the southern horizon.

HF propagation conditions may become degraded again during the local evening and early morning hours. Auroral flutter over the high and northerly middle latitudes together with anomalous auroral absorption will degrade signals passing through these regions. Lower latitudes should be less affected, but are expected to experience higher noise levels on 06 August.

There is a renewed probability for VHF backscatter conditions over the high and northerly middle latitudes, possibly stretching into the central and southerly middle latitudes if storming materializes.

> the APO feature, and got a little silly.

When I first purchased my Yaesu Ft-411, I left it on the counter turned on while reading the manual and the APO activated the litte tune. My wife (who is part Japanese) rushed over to the radio and asked me to make it do it again. I explained to her it would take a while to get it to do it again.

After powering it back up my wife sat there patiently waiting for the tune to play again. When it APO'ed agian she was able to recognize the tune from the summer she spent in Japan as a child.

The tune is a Japanese childrens song about the life of a butterfly. The part of the song being played is from the end of the song as the butterfly is dying. Intended meaning is that the radio is going to die? It makes sense. As to Micky Mouse, the Japanese are some of the biggest Micky fans in the world.

It was kind of fun when the radio turned off again to hear her sing (in Japanese of course) along with the song. By the end of the evening she had remembered the entire song (but not the translation unfortunately).

1639. Ten-Tec Argonaut II... Opinions?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-06 01:22:56 UTC
From: acm005@zeus.unomaha.edu
Message-ID: <19312.289da590@zeus.unomaha.edu>
Source record: 294711

I notice in my copy of the Amateur Electronic Supply Fall/Winter 1990 Catalogue a new HF rig from Ten-Tec called the Argonaut II. Wisely associating it with the venerable old Ten-Tec Argonaut I (which still gets snapped up at hamfests today), TenTec breaks through the "wide-lapels and lava-lamp" styling typical of their gear and offers a small, neat QRP package in an Icom/Kenwood-like styled case.

I looked through the annual QST index in the December 1990 issue, the files hf_rigs and qst_prodrev on ftp.cs.buffalo.edu under /pub/ham-radio, but couldn't find any mention of it (and I don't recall seeing it discussed in this group either).

Does anyone out there in net-land own one or have more information about it? It's a bit pricey overall ($1200, YOWCH!), but offers 160-10 CW/SSB and 10m FM, QSK CW, 30 memories, dual VFO's, and all the other standard modern goodies and puts out 500mw - 5 Watts, adjustable.

I asked the AES salesman if they've sold a lot of them and if the impression was favorable (yes and yes, but that's what a salesman is supposed to say! :-)

E-mail testimonials about older used gear will be preaching to the choir as I already own a 520S, an R-388, and a Hallicrafters SX-62. I'm interested in it as a box I can grab onto and take portable or mobile (and not drain my car battery in the process) or even run the "VCR Gauntlet" at my apartment.

And the fact that it is USA-made doesn't hurt (I also was not terribly impressed with the ongoing quirks of the 2 Kenwood lemons at the college club I was a member of).

If there is a significant quality and service/support difference with the TT, I might go with it. Otherwise, a Kenwood TS-140, and Icom 726, or a Yaesu 747 will easily come in at under $900.

Feel free to post, though I am quite willing to summarize and post all E-mail responses.

I went from Tech. to Advanced and it took 8 weeks 2 days.
The FCC must of purchased some new printing equipment. Two licenses are
printed on one 8 x 11 sheet of "un-alterable" paper with a laser printer.

1641. Two-Line Orbital Element Set: Space Shuttle

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-06 02:21:48 UTC
From: tkelso@blackbird.afit.af.mil
Message-ID: <9108060221.AA19772@blackbird.afit.af.mil>
Source record: 294707

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

1642. More ICOM 2410 confusion

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-06 02:59:45 UTC
From: ker@cbnewsj.cb.att.com
Message-ID: <1991Aug6.025945.16795@cbnewsj.cb.att.com>
Source record: 294708

In my attempts to discover what is happening with the IC-2410 I've received the following stories:

Story 1) From ICOM contact #1. The radio shipped with an LCD display that had light letters on a black background. In a month it will start shipping with an LCD display with dark letters on a light background.

Story 2) From ICOM contact #2. The radio never shipped and is awaiting a determination of price prior to shipping.

Story 3) From a ham dealer in Washington. ICOM received the radios from Japan with LED displays and returned them all to Japan. They are now waiting for radios with LCD displays.

Story 4) From a ham dealer on the east coast. The dealer has the radios in stock but they have displays that are impossible to read in the sunlight.

Story 5) From another ham dealer on the east coast. ICOM has radios with LCD displays, black letters, but can't ship until they get FCC approval.

Many of these stories are contradictory!!

>receive it on a single dish of such small dimensions. Post the info if you get
>any hard facts on it. Thanks...

The idea is (if I understood correctly), not to RECEIVE the TELEMETRY
but to only detect the transmission. Thus you can integrate the
received power over a very long time on two channels; signal and
background (integrated on a frequency band where no detected power
should be present) and subtract these from time to time. This
technique is called frequency switching and is used in molecular line
radio astronomy. This requires that you know very accurately the
frequency (and Doppler of course) of the transmission. That should do
the trick, let's try!

1645. AHT-2000 Handheld.

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-06 09:13:25 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <06.Aug.91.10
Source record: 294713

The 'Review' of the AHT2000 horrified me! What *I* want in a radio is
as follows:-

Mono-band (2 meters) only; transverters for other bands.
VFO-tuned, *NOT* small-step synthesizer, with a nice big flywheel on the
TUNE control to give it some feel.
Maybe one or two memories to store the local repeater freqs.
AM/FM/SSB capability.
100 watts continuous RF output irrespective of output SWR (how can i
use the radio as an experimental RF-heater if it throttles back at odd SWRs?)
100% duty-cycle all modes (for RTTY/SSTV/FAX when you need radio to operate
for maybe 15 minutes continuous)
At least 8 watts of audio without distortion (helps in noisy environments).
Bomb-proof front-end (tuned cavity filters?) to keep other RF crud out.
Rugged construction (waterproof, able to survive being trampled when people
get into your car and fail to notice the radio...) *MUST* have diecast case
not pressed sheet-metal or plastic. Turned metal knobs for maximum tactile
satisfaction.
Runs on 24 volts DC or 115/230VAC.
Sensibly-sized controls for those of us with normal-sized fingers!

Ok its not like anything currently available (is it?) but it would fulfil
my requirements perfectly! Usable as a base station, mobile, or 'manpack
portable' when fitted with a lightweight gel-cell.
Now if only i could take a month off work to design/build the beastie;
a few Plessey SL600-series ICs, some VMOS power-FETs, Clapp VFO using
ceramic formers & silver-mica capacitors; Ahhhh! Good old Analog RF engineering.

No, no, no, you don't need batteries _or_ sunshine, the builtin RTG is good for a decade! Of course the original poster fogot to mention the price tag for the base unit (without the RTG). I'd like a couple of them too, but with a list price of $10K it's going to be a while. Besides, there are no cellular or trunking features, no ACSSB, no ATV accessories, and no builtin 450-MHz oscilloscope!

1 INTRODUCTION

We at Alinco would like to thank you for purchasing the ALINCO DJ-560T (US Model)/DJ-560E (European Model). Radios and other products made by ALINCO rank as some of the finest in the world. Your DJ-560T/E has been manufactured and tested very carefully at the factory and will give you satisfactory operation for many years. We are confident that you will be very satisfied with your choice of this fine ALINCO radio.

1.1 STANDARD ACCESSORIES

When you unpack your ALINCO transceiver, you will find the standard accessories which include:

1. Ni-Cad Battery Pack (7.2V @ 700mAH).EBP-10N
2. AC Wall Charger for EBP-10N.....EDC-21 (120V) for DJ-560/T
EDC-17 (220/240V) DJ-560/E
3. Belt Clip.....EBC-1
4. Hand Strap
5. Dual Band Rubber Flex Antenna

1.2 OPTIONAL ACCESSORIES

To enhance your DJ-560 radio further, optional accessories are available. At ALINCO, we strongly recommend that you purchase appropriate accessories to get full features and performance from your radio.

1. Ni-Cad Battery Pack (12V @ 700mAH).EBP-12N
2. AC Wall Charger for EBP-12N.....EDC-22 (120V) for DJ-560/T
EDC-18 (220/240V) DJ-560/E
3. Mobile DC Power Cable/Charger
with Noise Filter....EDC-26
w/o.....EDC-13
4. Earphone.....EME-6
5. Earphone/Microphone w PTT.....EME-4
6. Speaker/Microphone.....EMS-2Z
7. Headset with PTT/VOX.....EME-10
8. Leather Case for DJ-560 w EBP-10N..ESC-11

2 SPECIFICATIONS

The specifications outlined for this product are for use in the amateur bands only. No guarantee or warranty, either specific or implied, will apply to any function or specification outside the amateur bands. Individual radios may experience different performance and/or specification levels. All specifications and features are subject to change without notice or obligation.

2.1 GENERAL SPECIFICATIONS

Channel Spacing: 5, 10, 12.5, 20, 25 Khz steps
Memory Channels: 42 Channels (20 VHF, 20 UHF and
Independent Call Channels
Antenna Impedance: 50 Ohms unbalanced
Microphone Input Impedance: 2K Ohms
Signal Type: F3
Power Supply Requirements: 7.2 Volts DC
Dimensions:
Height = 169mm (6.65")
Width = 57mm (2.24")
Depth = 32mm (1.23")
Weight: Approximately 440g (.97lbs)
DTMF: 16 Button Key Pad

Subaudible Tones: Encode and Decode installed

2.2 US (DJ-560T) FREQUENCY COVERAGE

VHF Band: 144.000 - 147.995 Mhz (TX)
130.000 - 173.995 Mhz (RX)
UHF Band: 440.000 - 449.995 Mhz (TX)
400.000 - 519.995 Mhz (RX)

2.3 EUROPEAN (DJ-560E) FREQUENCY COVERAGE

VHF Band: 144.000 - 145.995 Mhz (TX)
130.000 - 173.995 Mhz (RX)
UHF Band: 430.000 - 439.995 Mhz (TX)
400.000 - 519.995 Mhz (RX)

2.4 TRANSMITTER SPECIFICATIONS

Output Power: 2 Watts with Standard EBP-10N Battery
5 Watts with Optional EBP-12N Battery
Modulation System: Variable reactance FM
Max. Freq. Deviation: +/- 5kHz
Spurious Emission: Less than 60db below carrier
Tone Frequency: 67.0 to 250.3 Hz (38 selections)
DJ-560T (Subaudible Encoding Tone)
DJ-560E (1,750 Hz Tone Burst)
Microphone: Electret Condenser
Operating Mode:
Simplex:
Duplex: 5khz steps minimum between 0-9.995 Mhz
from receiver frequency.
DTMF Encoder: Built-in and included as standard
CTCSS Decoder: Built-in and included as standard

2.5 RECEIVER SPECIFICATIONS

Receiver System: Superheterodyne, Dual Conversion
Sensitivity: 12dB SINAD less than - 15dB per microvolt
Intermediate Frequency: VHF - 1st IF 55.05 Mhz
2nd IF 455 Khz
UHF - 1st IF 58.125 Mhz
2nd IF 485 Khz
Audio Power Output: 250 mw (10% Total Harmonic Distortion)
Speaker Impedance: 8 Ohms

3 DESCRIPTIONS

This section will discuss what the function or control is
and how to use it. The sub-sections are broken down into
smaller sections for easy access.

3.1 FRONT PANEL CONTROLS/FUNCTIONS

The following descriptions are those functions necessary to utilize full functionality of the DJ/560T/E.

(1) LCD DISPLAY PANEL

Refer to Section 3.6 for further details on the LCD display panel.

(2) CONTROL KEYPAD

The control pad includes 16 multi-functional command keys that control and execute various operations for the DJ-560T/E. It also serves as a DTMF keypad.

(3) MICROPHONE

An electret condenser microphone is built in to the front panel. When transmitting, speak directly into the microphone from a distance of approximately 5 inches.

(4) SPEAKER

The speaker is located below the key pad on the front panel. It is rated at 8 ohms and is not in operation when an external speaker is in use.

(5) VHF BAND KEY

Pressing this key allows for operation on the VHF band.

(6) UHF BAND KEY

Pressing this key allows for operation on the UHF band.

(7) MCH KEY

1. Press the "MCH" key to put the Main Band into Memory Channel mode. The letter "M" and a memory channel number (0-19) will appear. The "M" will flash if nothing has been programmed into the displayed memory. Pressing and holding the "MCH" key, the memory channel number will increment quickly one number at a time.

2. Press and hold the "FUNC" key, then press the "MCH" key to decrement the memory channel number. If you continue to hold these keys, the memory channel number will decrement quickly one channel number at a time.

Another way to increment and decrement the memory channel is to use the main tuning knob.

(8) MHZ KEY

1. Press the "MHZ" key once will increase the frequency by 1 Mhz. By holding this key down for more than 1 second will increase the frequency by 1 Mhz at a faster rate. Press any number on the key pad to stop 1 Mhz stepping.

2. Press and hold the "FUNC" key, then press the "MHZ" key once to decrease the frequency by 1 Mhz. By holding these keys down for more than 1 second will decrease the frequency by 1 Mhz at a faster rate. Press any number on the key pad to stop 1 Mhz stepping.

(9) 100K KEY

1. Press the "100K" key once will increase the frequency by 100 Khz. By holding this key down for more than 1 second will increase the frequency by 100 Khz at a faster rate. Press any number on the key pad to stop 100 Khz stepping.

2. Press the "FUNC" and "100K" key once will decrease the frequency by 100 Khz. By holding these keys down for more than 1 second will decrease the frequency by 100 Khz at a faster rate. Press any number on the key pad to stop 100 Khz stepping.

(10) SQL/BS KEY

SQL is short for the word SQUELCH. Activate this feature as follows:

1. Press and hold the "SQL" key to override the squelch on the band selected. In this mode, weak signals below the squelch threshold may be heard.

BS is short for Battery Saver. The battery saver "BS" feature reduces unnecessary battery drain by alternating between listening and the Battery Saver mode. If there is no operation for a period of about 3 seconds the "BS" mode will listen for a signal for approximately 400 ms then Battery Save for approximately 800 ms. This cycle is repeated continuously. Perform the following to activate or deactivate Battery Save feature.

1. Press and hold the "FUNC" key, then press the "BS" key until the display shows "BS ON". The frequency display will return after 2 seconds.

2. Press and hold the "FUNC" key, then press the "BS" key until the display shows "BS OFF". The frequency display will return after 2 seconds.

(11) PRI/PS KEY

PRI stands for Priority. When the "PRI" key is pressed the priority function is active. Refer to the section PRIORITY for a full description of features and operations.

PS stands for Program Scan. Program Scan permits user boundaries to be programmed and those ranges to be scanned. Refer to section 8 for more information on Scanning.

(12) ARM/MONO KEY

The ARM key is labeled but does not perform any operation on this radio.

MONO disables the sub-band. In other words only one band!

Example: Your listening to the VHF band and you don't want to listen to the sub-band (uhf) at all.

1. Press and hold the "FUNC" key, then press the "MONO" key. The sub-band frequency will disappear and be replaced by three dash marks indicating band is disabled. Repeat this step to activate the sub-band or press the sub-band selector key (VHF or UHF).

(13) LAMP KEY

1. Press the "LAMP" key to illuminate the LCD display. The lamp goes out automatically after five seconds.

2. If you wish for the lamp to remain on, press and hold the "FUNC" key, then press the "LAMP" key.

(14) +/- (SHIFT) KEY

The symbols "+" and "-" are used to indicate shift.

1. Press and hold the "FUNC" key, then press the "+/-" key until the desired shift appears on the LCD display.

The + symbol indicates that the transmitter will apply the offset with the transmitted frequency.

The - symbol indicates that the transmitter will subtract the offset with the transmitted frequency.

Simplex operation is active when neither the + or - symbol is displayed on the LCD display. If "OFF" appears in place of the frequency during transmit, the selected frequency is out-of-band.

(15) OFFSET KEY

Amateur radio repeaters utilize separate transmitter and receiver sections. The transmitter frequency may be offset either above or below the receive frequency according to repeater coordination conventions. The standard offset for the 2 meter band is 600 Khz. Offset for the 70cm band is 5 Mhz. Offset direction varies according to established band plans.

To select a repeater offset frequency, perform the following:

1. Select VFO mode.

2. Press and hold the "FUNC" key, then press the "OFFSET" key. An offset frequency will be displayed on the LCD display. Refer to section 2.4 on page 16 for factory defaults.

3. Turn the Main Tuning dial to the desired offset. You can also use the "MHz" and "100K" keys to assist in obtaining the offset frequency.

4. Press the Main Band (VHF or UHF key) or "PTT" to complete offset procedure.

DJ-560T DJ-560E

VHF: 600 Khz (0.60) VHF: 600 Khz (0.60)
UHF: 5 Mhz (5.00) UHF: 7.6 Mhz (7.60)

(16) REV KEY

This function reverses the transmit and receive frequencies. The transmit frequency becomes the receive frequency and the receive frequency becomes the transmit frequency. This key is used in conjunction with repeater operation. If the transmit frequency is out of range, the transmitter won't transmit. Please refer to section 10.1 for more information.

(17) A/UP ARROW AND DIAL M KEY

The "A/UP ARROW" key serves many purposes, it:

o Increments frequency one channel step while in VFO
o In VFO mode hold the key down to scan incrementally
o Increments OFFSET while in OFFSET function
o Increments STEP while in STEP function
o Increments tone frequency while in TONE F function

The "DIAL M" key is used for automatic dialing. Refer to section 10.3, 11, 11.1 on page 29 for more information on AUTOMATIC DIALING.

(18) MW KEY

MW stands for Memory Write. This function is used to write/store frequencies and features into a memory channel. Refer to section 6.2.2 for more information.

(19) M.SKIP KEY

This key is used to skip select memory channels during a memory scan.

(20) STEP KEY

The "STEP" function is used to select desired incremental changes of receive/transmit frequencies, in steps of 5, 10,

12.5, 20 or 25khz. Get more information on "GETTING STARTED" in section 2.4.

1. Select a VFO.

2. Press and hold the "FUNC" key, then press the "STEP" key. The channel step will change each time the "STEP" key is pressed. You can also change the channel step by using the main tuning knob, A/UP ARROW or B/DOWN ARROW keys.

3. Press the Main Band (VHF or UHF) key to set channel step and return to operating frequency.

4. After channel step is set, the receive/transmit frequency will increase or decrease by the value selected when you turn the main tuning knob.

(21) B/DOWN ARROW AND K.L F.L KEY

The "B/DOWN ARROW" key serves many purposes, it:

o Decrements frequency one channel step while in VFO
o In VFO mode hold the key down to scan decrementally
o Decrements OFFSET while in OFFSET function
o Decrements STEP while in STEP function
o Decrements tone frequency while in TONE F function

K.L stands for Key Lock. In the key lock mode, most control and command keys are locked and don't function. F.L stands for Frequency Lock. In this mode both bands are locked and cannot be altered.

These are useful features to prevent unauthorized functioning while the radio is in unattended monitoring mode. Here's how to use these features.

1. Press and hold the "FUNC" key, then press the "K.L F.L " key. Each time you press the key, you will toggle the field which will be displayed as follows: KL, KL and FL ON, FL OFF.

(22) BEEP BELL KEY

When the BEEP is on, each key pressed will sound a BEEP. The BELL function is a visual indicator that a signal is being received. It is useful when the Tone Squelch or Code Squelch functions are in use.

1. Press and hold the "FUNC" key, then press the "BEEP BELL" key. Each time the "BEEP BELL" key is pressed the display will cycle through BELL (accompanied with an audio symbol), BEEP OFF, BEEP ON functions. Make a selection and continue.

2. Press a main band (VHF or UHF) key, or PTT to store selection and return to the frequency display.

The BELL function may be set and activated on both bands at the same time. The BEEP will sound only if the BEEP function is on.

(23) TMS VCS KEY

This key is used to select 1 of 3 scan modes. Refer to section 9 for more information on TMS.

(24) APO KEY

This key is used to Automatically Power Off the radio. The APO function prevents inadvertent waste of battery power when the radio is left ON unintentionally. Here's how to use it.

1. Press and hold the "FUNC" key, then press the "APO" key. The display will indicate current setting.

2. Press the "APO" key again to toggle the LCD display from "APO ON" to "APO OFF". If "APO ON" is selected, it becomes active immediately. After about 30 minutes of no activity, a beep is emitted and the LCD display becomes blank. Battery power has now been removed from the radio. To reinitialize APO, turn the radio off and back on again.

3. To cancel APO, press and hold the "FUNC" key, then press the "APO" key again until "APO OFF" appears on the LCD.

(25) ABX/PTT.L KEY

When the Automatic Band Exchange (ABX) function is active, the band that detects the presence of a signal becomes the Main Band.If both bands are quiet, the first band to receive a signal becomes the main band. If the main band is active it remains the main band even if the sub-band becomes active. The transmitter will function on whichever band is the main band when the PTT switch is pressed.

1. Press the ABX key for more then a 1/2 second. Notice how one band indicator remains on while the other band indicator blinks. This means that ABX is active. If ABX key is pressed for less than a 1/2 second the band exchange doesn't become active.

2. Press the ABX key only to disable ABX function.

3. To cancel the ABX function, press the ABX key again.

In the PTT.L (PTT LOCK) mode the PTT switch is disabled. Unintentional transmitting is prevented in this mode. Perform the following to lock the Push to Talk (PTT) key.

1. Press and hold the "FUNC" key, then press the "PTT.L" key. The PTT.L symbol will appear in the LCD display. Press the "PTT.L" key again to unlock the PTT key. The PTT.L symbol will not be displayed on the LCD.

(26) D.SQL/DSQ SET KEY

These keys are used in conjunction with DTMF squelch control. Get more information on DSQ in section 12.

(27) P G KEY

This key is used in conjunction with DTMF squelch control. Get more information on the "P G" key in section 12.

(28) T.SQL/TONE F KEY

The Tone Encoder and Tone (Decoder) Squelch function is standard on the DJ-560T/E. Tone Encode and Decode work on the main band only. The DJ-560T/E has 38 settings from 67.0 khz to 250.3 khz. Utilize the "TONE F" key to access these settings. Access to an increasing number of repeaters is restricted by requiring that a sub-audible tone be transmitted with the input signal to open the repeater. To select the needed tone, perform the following:

1. Press and hold the "FUNC" key, then press the "TONE F" key. A tone frequency will appear in the LCD display.

2. Rotate the main tuning dial or either the "UP ARROW" or "DOWN ARROW" key to the desired tone frequency.

3. Press either the "VHF" or "UHF" key to return to the main band.

The tone frequency is now stored and will be transmitted with the repeater input frequency. Tone operation is discussed further in section 10.3 located on page 28.

Sub-Audible Tone Chart
======================================
67.0 71.9 74.4 77.0 79.7 82.5
85.4 88.5 91.5 94.8 97.4 100.0
103.5 107.2 110.9 114.8 118.8 123.0
127.3 131.8 136.5 141.3 146.2 151.4
156.7 162.2 167.9 173.8 179.9 186.2
192.8 203.5 210.7 218.1 225.7 233.6
241.8 250.3

(29) CALL/CALL.W KEY

Each band has 1 Call channel which is immediately accessible by pressing the "CALL" key. An often used frequency of interest such as a preferred local repeater, is usually programmed into the Call channel. Refer to

section 6.3 on page 20 for more information.

3.2 TOP PANEL CONTROLS/FUNCTIONS

(1) BNC Antenna Connector

You should attach a suitable Dual-Band antenna that will yield a low SWR. The antenna connected should satisfy both the 2 meter and 70 cm (440Mhz) band.

(2) VHF VOLUME CONTROL

Adjusts the VHF audio level. Rotate control clockwise to increase volume , and counter clockwise to decrease.

(3) VHF SQUELCH

Start by turning the knob fully counter clockwise, then rotate the knob back clockwise until background noise is silent.

(4) POWER ON/OFF AND UHF VOLUME CONTROL

Power is not applied to the radio when the POWER knob is fully counter clockwise. When the POWER knob is rotated clockwise, power is applied to the radio and volume for the UHF band may be adjusted.

(5) UHF SQUELCH

Start by turning the knob fully counter clockwise, then rotate the knob back clockwise until background noise is silent.

(6) MAIN TUNING DIAL

Press the VHF or UHF key to select the main band. The main tuning dial/knob may be rotated in either direction to select transmit and receive frequencies, frequency steps, sub-audible tones and transmit frequency offsets.

If the FUNC key is pressed and held, an "F" will appear on the LCD display. The frequency will increase/decrease by one MHz depending on the direction of the tuning knob rotation.

(7) SPEAKER JACK

An external speaker rated at 8 ohms may be plugged into this jack. The built-in speaker is disabled when an external speaker is plugged into this jack.

(8) MIC JACK

An external microphone may be plugged into this jack. We would like to suggest some ALINCO optional accessories that

have been tested with this radio:

o EME-4 o EMS-2Z o EME-109

Refer to section 1.1, 1.2 on page 1 for more information.

3.3 LEFT VIEW CONTROLS/FUNCTIONS

The following controls are located on the left side of the radio as viewed with front panel facing the operator.

(1) FUNCTION KEY

Controls access to secondary functions. These secondary functions are those functions printed in green on the front panel. It is necessary to activate the FUNCtion key to access these secondary functions. When the "FUNC" key is pressed the letter "F" will display in the upper left-hand portion of the LCD display. While holding the "FUNC" button, press the desired command key.

(2) PTT SWITCH

Press and hold this button to transmit. While holding the PTT SWITCH you may speak into the microphone.

*** NOTE ***

On the DJ-560E the lower portion of the PTT SWITCH is used to transmit Tone Burst, and the upper button is the PTT SWITCH. On the DJ-560T either button activates PTT SWITCH.

(3) BATTERY LOCK BUTTON

The battery lock button releases the battery from the radio. The battery is keyed in order to avoid the battery from being inserted incorrectly. To attach the battery, position it below the radio and slide battery from left to right until the lock snaps battery into place. To remove battery, push and hold the lock button upwards and slide the battery to the left (from vantage point where radio front panel is facing you).

3.4 RIGHT VIEW CONTROLS/FUNCTIONS

The following controls are located on the right side of the radio as viewed with front panel facing the operator.

(1) VHF/UHF DUAL EXTERNAL SPEAKER JACK

The DJ-560T/E features an external stereo speaker jack that makes accessible the audio supplied from each band (UHF/VHF). When a stereo headset is used, each band is heard separately, in each earphone. Separate external speakers may be plugged into this jack by using a mini dual

stereo adapter plug. Volume from the VHF band will be heard on the Left channel and UHF will be heard on the Right channel.

*** CAUTION ***

Inserting a standard mono plug into this jack will short circuit the UHF channel. USE STEREO PLUGS ONLY!

*** NOTE ***

When this jack is in use, the audio jack located on the top of the radio will be disabled.

(2) DC IN JACK

Utilizing this jack will provide maximum output power. Plug an external 13.8 VDC power source into this jack. Observe correct plug polarity. The EDC-13 or EDC-26 is recommended as optional accessories. Refer to section 1.1, 1.2 on page 1 for additional information on OPTIONAL ACCESSORIES.

3.5 REAR PANEL CONTROLS/FUNCTIONS

(1) TRANSMIT POWER SWITCH

There are two output power settings, "L" for low and "H" for high. The output power varies due to the battery type and is described as follows:

EBP-10N (7.2VDC).....High Power ??? Watts
Low Power ??? Watts

EBP-12N (12VDC).....High Power ??? Watts
Low Power ??? Watts

3.6 LCD DISPLAY DESCRIPTIONS

(1) FUNCTION KEY

Controls access to secondary functions. These secondary functions are those functions printed in green on the command and control function keys. It is necessary to activate the FUNCtion key to access these secondary functions. When the "FUNC" key is pressed, the letter "F" will display in the upper left-hand portion of the LCD display indicating that FUNCTION is active. While holding the "FUNC" button, press the desired command key.

(2) TRANSMITTER SHIFT

The shift selects + or - repeater input frequency, or simplex operation.

(3) DIAL

The telephone symbol appears, the automatic telephone dialer function is activated. In this mode, up to 16 telephone numbers, characters, and letters may be stored and transmitted automatically. Refer to section 10.3, 11, 11.1 for more information.

(4) PTT.L

The "PTT.L" symbol indicates that the PTT switch is locked. The radio will not transmit even if the PTT switch is pressed accidently.

(5) BELL

When the sound symbol appears on the LCD display it means that the bell function is active. In this mode the sound symbol flashes and an audible tone alert sounds when a signal is received.

(6) KL

KL stands for KEY LOCK. When "KL" is displayed, the command and control function keys are locked out. Utilizing this function prevents accidental use of command and control pad keys.

(7) UHF

This symbol indicates that the UHF band has been selected.

(8) DSQ

When "P" or "G" is displayed, DSQ functions are enabled. DSQ stands for DTMF squelch control.

(9) T SQL

Pressing the T SQL key will toggle the letter "T" or "T" "SQL" on the display. When the symbol "T" appears, the Tone encoder is activated. If the "T" and "SQL" appears the Tone encoder and Tone squelch functions are activated.

(10) VHF

This symbol indicates that the VHF band has been selected.

(11) MEMORY CHANNEL

This symbol indicates that the selected band is in memory mode and displays the memory channel number.

(12) FREQUENCY

Receive and transmit frequencies, offset and tone frequencies, channel steps, DSQ codes and dialer memory channel numbers are displayed in this area depending on the selected mode.

(13) S/RF

In receive mode the "S/RF" symbol and (Signal/RF) bars will be displayed to show signal strength. When transmitting occurs, the S/RF bars indicate RF output power.

(14) FREQUENCY DECIMAL POINT

When receive, transmit or offset frequencies are displayed on the LCD, the decimal point divides MHz and KHz.

(15) TONE DECIMAL POINT

When the Tone frequency is displayed, the decimal point divides Hz and 0.1 Hz.

(16) FULL

The symbol "FULL" will appear when either the received signal or transmitter power output are at their maximum.

*** NOTE ***

You may verify all display segments by pressing the "FUNC" and "PTT" key while turning the power on knob.

Two segments display on radio LCD but have no function on the DJ-560T/E. They are "AIR" (Airband) and "D." for ?????.

4 GETTING STARTED (Receiving)

1. Adjust the following switches and controls on the top of the radio.

o POWER/UHF KNOB: OFF

o VOLUME CONTROLS: Fully Counter Clockwise
o SQUELCH CONTROLS: Fully Counter Clockwise

2. Connect a battery or external 13.8 Volt DC Power Supply to the radio.

3. Connect an antenna with the appropriate antenna connector to the top of the radios. The type of antenna fitting that is expected is a BNC type.

4. When the POWER knob is rotated clockwise, power is applied to the radio and volume for the UHF band may be adjusted. The display should be illuminated and indicate frequencies for VHF and UHF. The initial factory delivered settings are:

VHF

VFO Frequency: 145.000 Mhz DTMF Squelch: None
Memory Channel: 1 Memory Frequency: Empty
Channel Step(560T): 5 khz Scan Type: Busy Scan

Channel Step(560E): 12.5 Khz DSQ Setting: None
Shift: None Call Frequency: 145.000 Mhz
Offset Frequency: 0.6 Mhz Tone Setting: None
Tone Frequency: 88.5 Hz

UHF

VFO Freq. 560T: 445.000 Mhz DTMF Squelch: None
VFO Freq. 560E: 433.000 Mhz Memory Frequency: Empty
Memory Channel: 1 Scan Type: Busy Scan
Channel Step(560T): 5 khz DSQ Setting: None
Channel Step(560E): 12.5 khz Call Freq.(560T): 445.000 Mhz
Shift: None Call Freq.(560E): 433.000 Mhz
Offset Freq.(560T): 5 Mhz Offset Freq.(560E): 7.6 Mhz
Tone Setting: None Tone Frequency: 88.5 Hz

5. Adjust the volume controls on each band until a signal (or noise) is heard.

6. Rotate the Main tuning dial, and select an open frequency on each band. Rotate the squelch controls clockwise on each band until the noise disappears and the S/RF indicator doesn't illuminate.

7. Select the desired band by pressing the VHF or UHF buttons. The VHF symbol will be displayed when VHF is enabled and UHF will be displayed when UHF is enabled.

*** NOTE ***

If external power source is connected, be sure to power off the radio before turning off the power supply.

4.1 FREQUENCY STEP

The "STEP" function is used to select desired incremental changes of receive/transmit frequencies, in steps of 5,10,12.5, 20 or 25khz. Use this feature as follows:

1. Select a VFO.

2. Press and hold the "FUNC" key, then press the "STEP" key. The channel step will change each time the "STEP" key is pressed. You can also change the channel step by using the main tuning knob, A/UP ARROW or B/DOWN ARROW keys.

3. Press the Main Band (VHF or UHF) key to set channel step and return to operating frequency.

4. After channel step is set, the receive/transmit frequency will increase or decrease by the value selected when you turn the main tuning knob.

4.2 KEYPAD ENTRY

When frequency is selected by key pad direct entry, numbers will appear on the LCD display as they are entered on the key pad.

1. Select a desired band by pressing either the VHF or UHF key.

2. Begin by entering the 100 MHz digit. Upon entering the first digit, the band indicator (VHF or UHF) will begin to flash.

3. Enter the 10 Mhz digit.

4. Enter the 1 MHz digit.

5. Enter the 100 KHz digit.

6. Enter the 10 KHz digit. If the radio is in 10 KHz or higher step, a beep will sound and the band indicator will stop flashing.

7. Enter the 5 KHz digit if the radio is set for 5 KHZ step.

4.3 CLEARING ENTRY

To clear an error during key pad entry, you may:

o Press the VHF or UHF band key.
o Press the PTT key.

5 TRANSMITTING

1. Make sure that you follow all steps set forth in the "GETTING READY" section (Section 4) first.

2. Select a frequency, shift direction, shift value, and PL tone frequency.

3. Check to see if the frequency is in use before transmitting.

4. Select appropriate transmitter output level by the switch located on the rear panel of the radio.

5. Press the PTT switch and speak approximately 5" from the microphone, located on the front of the radio.

5.1 POWER OUTPUT SETTING

There are two power settings on the DJ-560T/E. You may select either High (H) or Low (L) from a switch located on the rear of the radio.

*** WARNING ***

It is possible to cause UHF receive interference while transmitting on VHF. To avoid this from happening, make sure that the VHF frequency x 3 does not equal the frequency on UHF. For example, if VHF transmit frequency is 146.190 the UHF frequency should not be set at 438.570.

5.2 TONE BURST (DJ-560E ONLY)

Many European repeaters require a 1,750 Hz tone burst to access a repeater. To transmit a tone burst press the tone burst button.

6 TRANSCEIVER MODES

The DJ-560T/E has 3 modes; VFO mode, Memory mode and Call mode.

6.1 VFO MODE (Variable Frequency Oscillator)

Press either the VHF or UHF key on the front panel. The transceiver will be in VFO mode. This mode is used to change frequency and select the desired channel step, offset frequency (up to 10.995 MHz by 5 KHz), tone frequency (38 frequencies in Hz),etc.

6.2 MEMORY MODE

The following guidelines will help you to program and manipulate memory channels. To select the memory mode, press the "MR" key. The most recently used memory channel will display :

o Frequency
o Memory channel number
o Other programmed functions

You can scan the memory channels with the "MCH" key held down, elect to skip any memory channel with the "M.SKIP" key, or select the scan type with the "TMS VCS" key. Refer to the section SCANNING FUNCTIONS (Section 8) for more information.

The DJ-560T/E has two (02) banks of memory channels:

1ST the VHF bank has 20 memory channels that are accessed with the "MCH" key.

2ND the UHF bank has 20 memory channels that are accessed with the "MCH" key.

6.2.1 SCROLL MEMORY

Scrolling the VHF or UHF bank of memory channels up or down can be accomplished 1 of 2 ways.

MCH KEY

1. Press the "MCH" key to put the Main Band into Memory Channel mode. The letter "M" and a memory channel number (0-19) will appear. The "M" will flash if nothing has been programmed into the displayed memory. Pressing and holding the "MCH" key, the memory channel number will increment quickly one number at a time.

2. Press and hold the "FUNC" key, then press the "MCH" key will decrement the memory channel number. If you continue to hold these keys, the memory channel number will decrement quickly one number at a time.

Another way to increment and decrement the memory channel is to use the main tuning knob.

6.2.2 PROGRAMMING A MEMORY CHANNEL (MW KEY)

To write functions to any memory channel, it is necessary to first set those functions in the VFO mode.

o Select VFO mode (VHF or UHF band).
o Select the receive frequency.
o Select the repeater shift - or +
o Select the required offset. Consult your Repeater Directory.
o Select the proper PL [CTCSS] subaudible tone "T". Consult your Repeater Directory.
o Select Tone Squelch (Decoder) "T SQL".
o Select Tone Frequency

After selecting and setting the required functions you can write (store) those functions to a memory channel as follows:

1. Select VFO mode.

2. Select a frequency, shift direction, shift value, PL subaudible tone, Tone squelch and Tone frequency.

3. Press the "MCH" key. The "M" memory indicator and channel number will be displayed on the LCD. If "M" is flashing, it means that this channel number has no information stored.

4. Turn the Main Tuning Dial clockwise to choose the desired memory channel number (clockwise to increase, counter clockwise to decrease). Select the desired memory channel number (0 to 19).

5. When you have selected the memory channel you want, press and hold the "FUNC" key along with the "MW" key to write (store) to memory.

6.3 CALL MODE

The CALL mode allows a single key to access an immediately desired programmed frequency. Each band has one Call Channel which can be accessed by pressing the CALL key. A

preferred local repeater is usually programmed into the
Call Channel.

6.3.1 PROGRAMMING THE CALL CHANNEL (CALL.W)

To write functions to a CALL Channel, it is necessary to
first set those functions in the VFO mode.

o Select VFO mode (VHF or UHF band).
o Select the receive frequency.
o Select the repeater shift - or +
o Select the required offset. Consult your Repeater Directory.
o Select the proper PL [CTCSS] subaudible tone "T". Consult
your Repeater Directory.

o Select Tone Squelch (Decoder) "T SQL".
o Select Tone Frequency

After selecting and setting the required functions you can
write (store) those functions into a CALL Channel as follows:

1. Select VFO mode.

2. Select a frequency, shift direction, shift value, PL
subaudible tone, Tone squelch and Tone frequency.

3. Press and hold the "FUNC" key.

4. Press the "CALL.W" key to store frequency into the CALL
Memory channel.

6.3.2 ACTIVATING CALL CHANNEL

1. Select VFO mode.

2. Press the CALL key. The CALL indicator "C" will appear on
the LCD display.

3. Press the CALL key again to return to previous mode and
frequency.

*** NOTE ***

Pressing the CALL key for more than 5 seconds will activate
CALL PRIORITY (Dual Watch).

7 PRIORITY FUNCTIONS

The following priority functions are available:

o VFO Priority
o Memory Priority
o Call Priority (Dual Watch)

7.1 VFO PRIORITY

In this mode a VFO frequency is received for 3 seconds and a Memory frequency is received for 1 second in a continuous cycle. Here is how it works:

1. Select VFO mode (UHF or VHF) and VFO frequency.

2. Press the "MCH" key to activate Memory mode.

3. Rotate the Main Tuning Dial to a desired Memory Channel. You may also use the "MCH" up or down arrow to change

memory channels.

4. Press the desired VFO (VHF or UHF) key.

5. Press the "PRI" key to begin priority function.

6. Press "PRI" to stop the priority function.

*** NOTE ***

When a signal is received on the memory frequency a BEEP will be omitted from the speaker and the audio indicator will blink for 3 seconds.

7.2 MEMORY PRIORITY

In this mode a Memory frequency is received for 3 seconds and a VFO frequency is received for 1 second in a continuous cycle. Here is how it works:

1. Select VFO mode (UHF or VHF) and VFO frequency.

2. Press the "MCH" key to activate Memory mode.

3. Rotate the Main Tuning Dial to a desired Memory Channel. You may also use the "MCH" up or down arrow to change memory channels.

4. Press the "PRI" key to begin priority function.

5. Press "PRI" to stop the priority function.

*** NOTE ***

When a signal is received on the VFO frequency a BEEP will be omitted from the speaker and the audio indicator will blink for 3 seconds.

In memory priority, the transmitter may be activated on either frequency. Press the PTT switch when the desired frequency is displayed on the LCD.

7.3 CALL PRIORITY (Dual Watch)

The VFO frequency is scanned for approximately 1/2 second and the programmed CALL frequency is scanned for approximately 1/2 second.

1. Select either VHF or UHF as the Main Band.

2. If the CALL channel hasn't been programmed yet, refer to section 6.3.1 on page 20, 21 for more information.

3. Select either VFO or Memory channel mode.

4. Press the "CALL" key for more then 1/2 second. Call priority will begin to cycle between the CALL channel and the selected VFO or memory channel.

5. Press PTT or CALL to cancel CALL priority mode.

8 SCANNING FUNCTIONS

The DJ-560T/E offers various scanning options and 3 scanning modes described a little later on in this section. First lets look at the scanning options, they are:

VFO Scan - Scans either band independently.

Program Band Scan (VFO Mode) - Scans programmed lower to upper frequencies. The bands are independent of each other.

Memory Scan - Each band may scan memory channels independently.

8.1 VFO SCAN

Each band may scan VFO channels independently. When in Band Scan mode the DJ-560T/E scans by Channel step, by 100 Khz or by 1 Mhz steps. As the scan passes through any 500 Khz or 1 Mhz point a tone will sound if the BEEP function is active.

1. Select a VFO and press the "A/UP ARROW" key for approx. 1 second and release key. To scan in the opposite direction press the "FUNC" key and the "B/DOWN ARROW" key.

2. Whether you are cycling upward or downward, during scan the decimal point will flash indicating that scanning has begun.

NOTE

The scan rate is faster if you hold the UP or DOWN ARROW key down. The decimal point will not flash when these keys are held down. Scan frequency will decrease when the main tuning knob is rotated counter clockwise. The same holds true, if the main tuning knob is rotated clockwise the scan frequency will increase.

3. When a signal is received, scanning will stop and remain on that frequency. When channel goes quiet or Main Tuning Knob is rotated clockwise or counter clockwise, scanning will

continue.

4. To cancel scanning press either the "A/UP ARROW" or "B/DOWN ARROW" key.

All 3 scan types can be applied to Band Scan.

8.1.1 PROGRAM BAND SCAN MODE (VFO MODE)

This scan option allows the scanning of a range of VFO frequencies. Each band may have independent scan ranges. The lower band limit is programmed into Memory Channel 18. The upper band limit is programmed into Memory Channel 19. You may initiate Program Band Scan from either VFO or Memory mode.

Storing the Lower and Upper Ranges

Example:

1. Select VFO mode, for example VHF.

2. Select desired Lower Frequency via the key pad like 146.000.

3. Press the "MCH" key.

4. Rotate the Main Tuning Dial until 18 is displayed.

5. Press and hold the "FUNC" key, then press the "MW" key to store the selected Lower Frequency into memory.

6. Select desired Upper Frequency via the key pad like 146.100.

7. Press the "MCH" key.

8. Rotate the Main Tuning Dial until 19 is displayed.

9. Press and hold the "FUNC" key, then press the "MW" key to store the selected Upper Frequency into memory.

10. Press and hold the "FUNC" key, then press the "PS" key. Scanning from 146.000 to 146.100 has started. Press any numerical key or PTT to stop scan.

8.2 MEMORY SCAN MODE

This scan option allows the user to scan frequencies that have been programmed in any (or all) of the memory channels. Bands may be scanned individually or both bands may be scanned simultaneously.

1. Select a VFO and press the "MCH" key for approx. 1 second and release key. To scan in the opposite direction press the "FUNC" key and the "MCH" key.

2. Whether you are cycling upward or downward, during scan the decimal point will flash indicating that scanning has begun.

*** NOTE ***

The scan rate is faster if you hold the UP or DOWN ARROW key down. The decimal point will not flash when these keys are held down. Scan frequency will decrease when the main tuning knob is rotated counter clockwise. The same holds true, if the main tuning knob is rotated clockwise the scan frequency will increase.

3. When a signal is received, scanning will stop and remain on that frequency. When channel goes quiet or Main Tuning Knob

is rotated clockwise or counter clockwise, scanning will continue.

4. To cancel Memory Scan press the "MCH" key.

8.2.1 MEMORY CHANNEL SKIP MODE

Memory Channel Skip permits unwanted memory channels to be skipped during memory scan. This step presumes that you have already programmed some/all memory channels.

1. Press the "MCH" key.

2. Rotate the Main Tuning Dial until the memory channel that you want to skip is displayed.

3. Press and hold the "FUNC" key, then press the "M.SKIP" key. The decimal point will disappear from the frequency displayed, indicating this frequency will be skipped. Perform step 2 and 3 for each memory channel that you wish to skip.

4. To cancel Memory Channel Skip, press and hold the "FUNC" key, then press the press the "MCH" key. The decimal point will re-appear, and that memory channel will now be restored to scan status.

9 SCANNING TYPES

The DJ-560T/E offers 3 different scanning modes as shown below. The initial factory setting is the Busy Channel Scan.

Busy Scan - Stops at busy channel or frequency until clear, then resume scan.

Timed Scan - Stops at busy channel or frequency, then resume scan 5 seconds later.

Empty Channel Scan - Ignores busy channels and stops on inactive (empty) channel or frequency.

Selecting a Scan Type:

1. Select the desired Main Band.

2. Press and hold the "FUNC" key, then press the "TMS VCS" key. Each time this key is pressed another scanning mode option will appear.

3. Select the desired scanning mode, then press the desired Main Band key. The Scanning Mode is now set and display returns automatically 2 seconds later.

9.1 OTHER SCANNING INFORMATION

This subsection talks about all other information pertinent to radio scan.

9.1.1 1 MHZ STEP SCANNING

1. Press the "MHZ" key once will increase the frequency by 1 Mhz. By holding this key down for more than 1 second will increase the frequency by 1 Mhz at a faster rate. Press any number on the key pad to stop 1 Mhz stepping.

2. Press and hold the "FUNC" key, then press the "MHZ" key once will decrease the frequency by 1 Mhz. By holding these keys down for more than 1 second will decrease the frequency by 1 Mhz at a faster rate. Press any number on the key pad to stop 1 Mhz stepping.

9.1.2 100 KHZ STEP SCANNING

1. Press the "100K" key once will increase the frequency by 100 Khz. By holding this key down for more than 1 second will increase the frequency by 100 Khz at a faster rate. Press any number on the key pad to stop 100 Khz stepping.

2. Press and hold the "FUNC" key, then press the "100K" key once will decrease the frequency by 100 Khz. By holding these keys down for more than 1 second will decrease the frequency by 100 Khz at a faster rate. Press any number on the key pad to stop 100 Khz stepping.

9.1.3 DUAL BAND SCAN

You may want to scan both bands at the same time. You can perform that function by following this example.

Example: Dual Band Scan

1. Press the VHF key.

2. Press the "A/UP ARROW" key for approx. 1 second.

3. Press the UHF key.

4. Press the "A/UP ARROW" key for approx. 1 second.

9.1.4 SCANNING WITH PRIORITY

If you want to activate PRIORITY on both bands while SCANNING, no problem, follow this example.

Example: Dual Band Scan with Dual Band Priority

1. Press the VHF key.

2. Press the "A/UP ARROW" key for approx. 1 second.

3. Press the "PRI" key.

4. Press the UHF key.

5. Press the "A/UP ARROW" key for approx. 1 second.

6. Press the "PRI" key.

10 REPEATER OPERATIONS

Amateur radio repeaters utilize separate transmitter and receiver sections. The transmitter frequency may be offset either above or below the receive frequency according to repeater coordination conventions.

10.1 REV KEY

In some areas there may be repeaters operating on repeater frequency pairs, the exact reverse of another repeater in the area. That is, the input of one repeater is the output frequency of the other and vice versa. To avoid the inconvenience of reprogramming every time both repeaters are in range, the REV key allows instant reversal of the input and output frequencies and the offset direction. The REV function is also useful to check the repeater input to determine if another station is heard directly so you can go simplex. To activate the REV function:

1. Press and hold the "FUNC" key, then press the "REV" key. The repeater input frequency and opposite SHIFT indicator will appear on the LCD display panel.

2. Press and hold the "FUNC" key, then press the "REV" key again to cancel the REV function.

10.2 RESETTING RADIO

*** NOTE ***

Resetting the radio will erase all user programmed information (frequencies,shifts,offsets etc.) Make sure that this information has been written down before

proceeding.

1. Make sure radio is powered off.

2. Press and hold the "FUNC" key in while turning on the radio via the power knob. The LCD will display 145.00 (VHF) and 445.00 (UHF), and you can now access Cross Band Repeat.

10.3 PL ENCODE/DECODE

PL Encoding allows you to select the proper tone frequency to open another operators radio or repeater. PL Decoding enables another operator to select the tone your receiver requires enabling you to hear them. Unlike Code Squelch operation (Refer to section 12.2 for details) A specific tone frequency is used. Here's how to use PL Encoding/ Decoding.

1. Select a VFO.

2. Press the "T.SQL" key. Tone settings will cycle each time the "T.SQL" key is pressed. It cycles as follows on the LCD display:

o Tone Encoder Enabled with the letter "T" displayed on LCD.
o Tone Decoder Squelch with the letter "T" and "SQL" displayed on the LCD.
o When the "T" and/or "SQL" is not displayed, the encoder/decoder is disabled.

11 AUTOPATCH OPERATION (AUTOMATIC DIALER)

The DJ-560T/E offers one automatic dialer channel. The telephone number may be entered in either the VHF or the UHF frequency mode. The stored telephone number is transmitted on whichever band is selected as the main band.

11.1 PROGRAM AUTODIAL NUMBER

To enter a telephone number, perform the following:

1. Press and hold the "FUNC" key, then press the "DIAL M" key. The frequency display will be replaced by 4 dashes. The telephone symbol will display on the LCD and flash, indicating that the dialer memory is ready to accept the number to be stored. You may enter up to 16 numbers, letters and symbols, four at a time in four groups.

*** NOTE ***

After each group of four is entered the second group will replace the first group and so on.

2. The entered telephone number is stored by pressing the desired main band (VHF or UHF) key or PTT switch.

Change the number by repeating the steps 1 & 2 in this section.

11.2 TRANSMIT AUTODIAL NUMBER

After performing the steps in section 10.3, 11, 11.1, perform the following steps to transmit the programmed number.
1. Verify that the telephone symbol appears on the LCD display.

2. Press and hold the "PTT" switch, then press the "FUNC" key to transmit number.

*** HINT ***

If the repeater autopatch requires an entry of an access code as part of the telephone number, enter the code first, then the telephone number. All digits will be transmitted. In some cases you would have to enter the autopatch code manually, then use the dialer.

11.3 MANUAL DIAL

In some instances you may want to dial a number manually. perform the following steps.

1. The telephone symbol should not appear on your display. If it does, press and hold the "FUNC" key, then press the "DIAL M" key, then the "ABX" key.

2. Press and hold the "PTT" key.

3. Now dial the number on your keypad as you would a telephone.

11.4 DISABLE AUTODIAL

1. Press and hold the "FUNC" key, then press the "DIAL M" key, then the "ABX" key. The automatic dialer memory is now empty. The telephone symbol will disappear from the LCD display.

12 HISTORY OF THE DSQ FUNCTION

At the beginning of DSQ implementation, the first handheld radio by ALINCO to offer this functionality was the DJ-160T/E. This radio utilized DSQ in order to make private contact with a single operator or group of operators as deemed necessary, very much like a pager!

The DJ-160T/E original DSQ scheme allowed:

o 3 digits for group code (000 to 999)
o 1 digit for the operators "own" code (0 to 9)
o 1 digit for "other's" to have as a personal code (0 to 9)

As you can see, if you have more then 10 operators (0 to 9) you are out of luck when using private calling.

The next generation would be called "Expanded DSQ". These "Expanded" functions can be found in the DJ-560T/E handheld and incorporate:

o 3 digits for group code (000 to 999)

o 3 digits for the operators "own" code (000 to 999)

o 3 digits for "other's" to have a personal code (000 to 999)

o 3 digits to monitor an(other's) code

The DJ-560T/E is backward compatible with the DJ-160T/E and is currently utilizing "Expanded DSQ" with other ALINCO products such as the DR-590T/E mobile, other DJ-560T/E's and the DJ-F series. Here is a compatibility matrix that will help you to understand what is compatible with what!

DSQ COMPATIBILITY MATRIX

Radio Type	Original DSQ	Expanded DSQ
DJ-160T/E HANDHELD	Yes	No
DJ-560T/E HANDHELD	Yes	Yes
DR-590T/E MOBILE	No	Yes
DJ-F SERIES HANDHELD	No	Yes

Now that you understand that there was an original DSQ scheme and a newer "Expanded DSQ", we can fully discuss how they are to be used on the DJ-560T/E!

12.1 DSQ ORIGINAL SCHEME

DSQ stands for DTMF Squelch Control. As the original DSQ scheme, it is often used in conjunction with the DJ-160T/E. This is a very powerful feature that will allow you to call a particular individual or group of individuals. This feature is achieved by use of DTMF Tones that will either open (or keep closed) the DJ-560T/E. In Section 16.1, you will begin to understand how the original DSQ scheme works and how to transmit & receive with it!

12.1.1 DSQ "ORIGINAL" CODING

With DSQ paging, you can place a transmission in a variety of ways, as described below.

OPTION 1: 3 DIGIT GROUP CODE

By programming a 3 digit group code your members of a group would receive a common transmission. Perhaps this group wouldn't want to hear a transmission meant for another group that has another 3 digit code sequence.

EXAMPLE:

Lets say that you are helping the local police department find a missing child. They have split 10 radio operators into 2-five person teams. Let's call them team 1 and team 2.

Each member of team 1 has a radio with a group code of 111.

Each member of team 2 has a radio with a group code of 222.

The police have just found evidence that the child is definitely located in team 2 territory. The central transmission point now needs to contact the members of team 1 and fill them in on their findings. They will send out a 111 group code (tone sequence) to team 1. By virtue of the group code 111, all members of team 1 will hear the message and team 2 will hear nothing on their radios.

OPTION 2: 1 DIGIT PRIVATE "OWN" CODE

A single digit personal code would be utilized by an individual operator who would receive a private call.

EXAMPLE:

Lets say that you will receive some specific information. The other person will need to know your "own" code before your radio will receive a private call. Your "own" code is also necessary, because the other person receiving your message will see your "own" code displayed on their radio LCD.

OPTION 3: 1 DIGIT "OTHERS" CODE

This code is used to call a specific person in a group. It is the other persons "own" code.

EXAMPLE:

Lets say that an individual in team 1 needs to be given some specific information. We will send only that person the information and nobody else in the group. By virtue of their 1 digit "own" code, they will hear only their message.

OPTION 4: 1 DIGIT MONITOR CODE

When your "own" private code is sent to your radio, the "other's" private code can be memorized.

OPTION 5: MISC CODES

16 numbers, letters and symbols can be used for coding. Here's what you can use; 0-9, A-D, * and #. An "H" will appear on the LCD when the * is entered and upside down A will appear when the # is entered. The # sign is used as a wild card. Refer to WILDCARD for more information.

12.1.2 TRANSMITTING (PRIVATE CALLING IN A GROUP)

1. Select which frequency and band you wish to operate on.

2. Press and hold the "FUNC" key, then press the "P G" key until "G" appears on the LCD display.

3. Enter 3 digits for the group that YOU want to call followed by your 1 digit "own" code. In other words your personal ID code from 0 to 9.

EXAMPLE:

The first three digits are the group code, enter 111. The final digit is reserved for your "own" personal code, enter 2. Your display should look like this:

A111.2

4. Press and hold the "FUNC" key, then press the "P G" key until "PG" appears on the LCD display.

5. And now you must select the "others" single digit code. This is the operator you are calling. Lets say your calling operator 3! Enter "3" on the keypad. Notice how this digit is entered into the single digit area above the group code and just right of the band indicator.

6. Press the PTT key to transmit the DSQ code. The following example will illustrate what the tone stream looks like.

EXAMPLE:

The first 3 tones you will hear when you push on the PTT key will be the 3 digit group code (111). This will be followed by the "others" code (3). A delimiter character is sent followed by the last digit which identifies you (your "own" code) (2).

1113*2

12.1.3 RECEIVING (PRIVATE CALL IN A GROUP)

To receive a private call from another operator, setup your radio as follows:

1. Press and hold the "FUNC" key, then press the "P G" key until "PG" appears on the LCD display.

When the received DSQ code matches the first 4 digits of your display (group and own code), the DSQ "PG" indicator will begin to flash. If the "BEEP BELL" is off, the squelch will open for as long as the calling operator is transmitting. If the "BEEP BELL" is on, an audible beep will be emitted from the radio and the beep indicator will flash on the LCD display. Reset the flashing DSQ indicator by pressing the main band key.

The calling operators "own" digit will appear on your display next to the band indicator.

*** NOTE ***

If the received coded signal matches the "P G" pager code, the mode is selected automatically. When the "other's" code is not confirmed, an "E" will be displayed on the LCD instead of "A".

12.1.4 TRANSMITTING (GROUP CALLING)

1. Press and hold the "FUNC" key, then press the "P G" key until "G" appears on the LCD display.

2. Enter the 3 digit group code that YOU want to call followed by your 1 digit "own" code. In other words your personal ID code from 0 to 9.

EXAMPLE:

The first three digits are the group code, enter 111. The final digit is reserved for your "own" personal code, enter 2.

3. Press the Main band key. either VHF or UHF. The DSQ code is now stored and the LCD display will return to the Main Band frequency.

4. Press the PTT key to transmit the DSQ code. The following example will illustrate what the tone stream looks like.

EXAMPLE:

The first 3 tones you will hear when you push on the PTT key will be the 3 digit group code (111). This will be followed by a delimiting character. Immediately afterwards the digit which identifies you (your "own" code) will be sent (2). The entire sequence will end with 2 delimiting characters.

111*2**

12.1.5 RECEIVING (GROUP CALL)

To receive a group call from another operator, setup your radio as follows:

1. Press and hold the "FUNC" key, then press the "P G" key until "G" appears on the LCD display.

When the received DSQ code matches the first 3 digits of your display (group code), the DSQ "G" indicator will begin to flash. If the "BEEP BELL" is off, the squelch will open for as long as the calling operator is transmitting. If the "BEEP BELL" is on, an audible beep will be emitted from the radio and the beep indicator will flash on the LED display. Reset the flashing DSQ indicator by pressing the main band key or PTT.

The calling operators "own" digit will appear on your display next to the band indicator.

12.2 CODE SQUELCH

Well you might have decided that the "Original DSQ" function is not your cup of tea. Thats ok, maybe individual code squelch is more to your liking. This is different from Tone Encoding/Decoding (Refer to section 10.3). This gives you a choice to select your own 3 digit code, and only the person who knows your code will open your receiver. Here's how it should be used.

1. Select an operating frequency.

Example: Enter the 2 meter frequency of 146.520.

2. Press and hold the "FUNC" key, then press the "DSQ SET" key several times. Notice how you can scroll through A,B,C & D! These are the 4 DSQ memory channels. Each memory channel is very much like a mailbox. Each mailbox will hold 3 letters (digits). These digits represent your personal code squelch identification.

Example: Select code squelch memory channel "A".

3. Release the "FUNC" key now and select a 3 digit code squelch code using the keypad.

Example: Enter the 3 digit code 333.

4. Press the "FUNC" key to return the LCD display to operating frequency.

Example: Now you will see on the LCD display P45.52.

5. Press the "D.SQL" key repeatedly (2 times) until "C" appears in the 100 Mhz digit location.

Example: C45.620 or C46.000

6. Press the "PTT" to transmit the code squelch code with the transmitted signal.

*** NOTE ***

If the received code squelch signal matches the set code squelch code, a "C" will appear on the LCD, squelch will open and incoming signal will be received.

12.3 DSQ WILDCARDS

The "#" symbol is a wildcard that may be substituted for any one digit,letter or symbols used in DSQ codes. When the "#" symbol is entered it appears on the LCD display as an upside down A. The wildcard allows for the combination of many groups. If the first or first and second digits of several group codes are the same, you can replace the second and third digits (or just third digit) with a "#" mark, and thus transmit to all those groups.

Example:

1. Enter the 2 meter frequency of 146.520.

2. Press and hold the "FUNC" key, then press the "DSQ SET" key. Select any code squelch memory channel.

3. Release the "FUNC" key now and select a 3 digit code squelch code using the keypad.

Example: Enter the 3 digit code 1#5.

4. Press the "FUNC" key to return the LCD display to operating frequency.

Example: Now you will see on the LCD display P45.52.

5. Press the "D.SQL" key repeatedly (2 times) until "C" appears in the 100 Mhz digit location. If you want to see on your LCD display which group code is calling you, refer to the HINT on page 37.

Example: C45.620

If the incoming coded calls are anyone with a group code as follows, the call will be received by your radio.

o 105 through 195
o 1A5 through 1D5
o 1*5
o 1#5

6. When you receive a call from another station, the "C" will flash on and off for as long as the other operator is transmitting. Your radio has already memorized who was calling you, so press the "PTT" key and you will transmit to that station directly. When you have completed your QSO, enter the wildcard sequence again to open your radio to all other stations again.

*** HINT ***

If you want to see who was calling you, perform steps 1-6 in section 12.3. After step 5 press and hold the "FUNC" key, then press the "DSQ SET" key. When you receive the call, their group code will appear on the LCD display immediately.

1649. High speed CW TX/RX with PC?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-06 12:51:40 UTC
From: G8SJP.BRidge_House@rxuk.xerox.COM
Message-ID: <"6-Aug-91.1:51.PM".*.Iain_Philipps.Bridge_House@rxuk.Xerox.com>
Source record: 294719

Folks,

I'm looking for any information on techiniques which I might use to send/receive high speed CW using a PC (for meteor scatter purposes). Preferably, Public Domain or Shareware software requiring a minimum amount of hardware (building hardware isn't a problem for me, but it isn't fun any more, either :-).

Also, I couldn't find any pointers to Ham software archives accessible via FTP - anyone have any?

73 de G8SJP

1650. Re: ICOM IC-W2A power levels?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-06 13:08:36 UTC

In article <1991Aug3.134510.5489@cbnewsj.cb.att.com>, ker@cbnewsj.cb.att.com (kenneth.roser) writes:
> I'm considering purchasing an IC-W2A but can't find any specs as to
> what the transmit power levels are when operating off of the 7.2 and
> 12V battery packs. The stated power levels are for external 13.5-16 VDC.
>
> Can anyone complete this table?
>
Low power Med. Power High Power
BP81-84,90 7.2V 0.5W 1.5W or 1.5W 1.5W
BP85 12.0V 0.5W 1.5W or 3.5W(?) >5.0W (?)
external 13.5V 0.5W 1.5W or 3.5W >5.0W

When supplied with 12 - 16 VDC, the radio will put out greater than 5.0W on both the VHF and UHF radios. You then have the option of setting the 'low' power ouput to be either 0.5W, 1.5W or 3.5W - I would assume that you would also be able to do this with the BP85 (12V) battery pack, but since I don't have that battery pack, I can't verify this (as indicated by the (?)).

My W2A puts out >6.0W when supplied with 13.8VDC (using a Bird Wattmeter).

As far as PLL synthesis frequency accuracy, @146.160 MHZ output, I measured the output frequency (no input signal) to be 63HZ high (+0.43 PPM !). Quite impressive.

FM deviation measured +4.6KHZ, -4.5KHZ.

Radio was able to accept an input deviation of 24KHZ (!) before losing the signal. Input sensitivity came in at 0.12uV (to just break squelch).

GREAT radio!!!

writes;

<...The 'Review' of the AHT2000 horrified me...>

Me too.

The nearest thing to your spec I've ever owned was a Trio 9130. Nice simple, rugged, die-cast, 25W out on 144MHz, reasonable receiver performance, absolutely NO "bells and whistles". It was synthesised, though.

Pity I sold it. Sigh.

73,

Hugh, G0CNR.

1652. PC Code Program

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-06 13:56:00 UTC
From: JMG%TNTECH.BITNET@cunyvm.cuny.edu
Message-ID: <53E8EF5460C1BA62@TNTECH.BITNET>
Source record: 294722

I have noticed some postings about people wanting a good PC based code program.

I just got my license 3 months ago. I was able to go from 0-20+wpm in about that time using a program called "Super Morse" by WD5CID. It is a shareware program and can usually be obtained from electronic bulletin boards locally, or through shareware dealears-or contact the author.

My 8 year old som is using it with a great deal of success.

It is one of the best constructed computer programs I have come across.

> usually a local repeater carries it.

The NASA-Ames Amateur Radio Club retransmits NASA select on 145.585 (K6MF)
from the Ames Research Center located in Mountain View, CA. The simplex
transmission is broadcast with a continuous carrier and the antenna is
only in the tens of feet above the valley floor. Hence, I don't believe
that it is possible for your re-transmit to originate from K6MF.

On the other hand, there are several other sources in Southern California
for NASA select re-transmit, not the least of which is the W6VIO re-transmit
that is often carried by the Cactus Net throughout an area that reaches
from El Paso to San Francisco (including 449.000 in Santa Barbara).

For those in the Bay Area, there are usually several 440 repeaters that
carry NASA select. Some of them from the W6VIO feed, one from a Sacramento
feed, and one (KB5JR, 443.300) from the K6MF feed.

KB5JR is on Loma Prieta (3800 ft., 50W) and can be heard from Napa to Monterey.
KB5JR uses a VOX circuit to defeat the constant carrier from K6MF.

ATV of NASA select video and audio is available to those with line-of-sight
to Black Mountain.

If you are receiving a NASA select re-transmission in your area, NASA
would like to know. If you will mail me the particulars, I will post
them to spacelink and re-post the entire file once (t'will be long).

Nice post, but you missed the big new idea in handheld and mobile radios: voice control. I think that in the future there will be no keyboard at all; you'll just talk to your radio:

"Command: memory 12"
"Command: frequency 146.91"
"Command: power high"
etc.
This solves all keyboard problems, and gets away from having to manipulate your radio while driving. With a voice synthesizer for output, you can deal with the radio completely by voice. Only trouble is, if the radio really has 4 CPUs, it might get too smart for you:

"Command: frequency 146.91"
"Radio speaking: Not now, you haven't mowed the lawn! There'll be plenty of time for ham radio when all the work around here is done" {obviously programmed by an XYL}

I saw one of these radios at a recent "ICOM DAY" at an electronics store
in the bay area. It had orange illuminated numbers on a black background.
The ICOM rep gave no information at all about the display, even though
I told him that there was a picture of one on the back of CQ magazine with
black letters on an orange background. He also told me he did not know
what the price would be. All in all, he did not answer any of my
questions. The IC2410 does look like an extremely attractive radio, display
not withstanding.

I have heard that ICOM had a bunch of the orange on black displays, and that
they had built a batch of radios with that display. My source also said that
as soon as they ran out of those displays they would go back to the LCD type.

Thats all I know. Sorry.

The people at the electronics store also speculated that the 2410 would be priced in a range similiar to the current IC2400.

From: rachiele@NADC.NADC.NAVY.MIL
Message-ID: <9108061936.AA00643@next0.nadc.navy.mil>
Source record: 294629

I own a Kenwood 621, and on the whole I am very happy with it. As you say, it is just about the only thing on the market which will dual-band 220 and 2-meters. (There is also the Icom 901, for quite a bit more money. Someone was talking about a dual-band HT made by Standard I think, check the recent archives.) The only complaints I have about it are: The LED dial is not too readable in direct sunlight, and the receiver is not as sensitive as some other radios I've had (but this may be the antenna setup on my car, I'm not sure.) Both of these problems are supposedly fixed in the 631, but I haven't seen one. There are 2 antenna connections on short tethers, making connection easy. 16 memories in each band, plus a vfo and a call frequency. Independent sub-band tuning and squelch, a volume mix switch so you can control how loud the sub-band is relative to the main, selective auto band change. PL encoder is standard, decoder is optional. DTMF mike. Plenty of power (I think it's 25 on 220, 45 on 2). There is a mod you can do to cross-band repeat if you want. Did I forget anything? I think I got mine for under 600 new, but I forget where (one of the big mail-order houses.) Considering it was my only choice at the time, if I had it to do over again, I would. Hope that helped.

1660. Orbital decay question

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-06 21:33:46 UTC
From: rwb+@cs.cmu.edu
Message-ID: <14225@pt.cs.cmu.edu>
Source record: 294631

My naive interpretation of the keplerian elements orbital decay value
treated it as an acceleration, as in

```
MeanMotion = EpochMeanMotion + OrbitalDecay*(Time-EpochTime);
```

```
MeanAnomaly = EpochMeanAnomaly + EpochMeanMotion*(Time-EpochTime)
+ 0.5*OrbitalDecay*SQR(Time-EpochTime)
```

In the Amsat supplied BASIC programs, the terms in the above equations with
OrbitalDecay in them are doubled relative to my interpretation. Why is this?
Is it because the decay rate itself changes as the orbit decays?

How good is the decay rate in predecting LEO satellites with keplerians
a few weeks old?

>Sensibly-sized controls for those of us with normal-sized fingers!

YES!!!! When I went looking for a new rig in the mid-1980s, I couldn't believe the controls on some of the HF rigs, let alone the HTs. Real radios have knobs! Not miniature slide controls, or buttons that have to be pushed by something smaller than a ball point pen's sharp end.

I ended up buying a TS-530S - the only rig I found with real knobs, real finals, and controls whose function I could recognize. Of course, I did end up selling it and getting a Paragon, with all those little buttons. You would think I would learn...

> I have a chance of buying a Drake R-4A receiver for $135.00 . Is this a good
>deal? Was this a good receiver?

I'm more familiar with the R4B -- I think they are very similar.
(The R4C uses a different block diagram).

It's a very nice receiver if you don't mind the "vacuum-state" technology.
The R4B (and I think the -A also) has a broad (6-8 kHz) crystal filter
in the first IF, then converts down to 50 kHz to get selectivity. The
advantage is there are no extra crystal filters to buy -- you get
4.8, 2.4, 1.2 (I think), and .4 kHz filters with the standard radio.
Dynamic range is very good and phase noise is low. The analog dial
is marked in 1 kHz increments and tunes 25 kHz/revolution. (Not as
accurate as a digital dial, but very good for a mechanically-tuned VFO.)

Other features include passband tuning and a tunable notch filter.
Oh, and the noise blanker is standard. It transceives with a T4X xmtr.
$135 sounds about right for one in good condition.

Yes, you can decode DTMF there's several companies that make decoders.

A couple of well known companies here;

Midian Electronics Inc 2302 E 22nd Street Tucson, AZ 85713 USA
Ph. 602-884-7981 Fax 602-884-0422

Selectone Corp. 23278 Bernhardt Street Hayward,CA 94545-1621 USA
Ph. 415-887-1950 Fax 415-887-4011

The decoders average out about $60 each.

1670. "Standard" 12v Power Connectors?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-07 07:13:45 UTC
From: 1843eip@hickam-emh.af.mil
Message-ID: <9108070712.AA11239@ucsd.edu>
Source record: 294649

So it's time for round two of the standardized power connector discussion....

After the first round, I began an effort to get the Emergency Amateur Radio Club, Honolulu, to standardize on the Anderson Power Poles, since everyone raved about them last time...now the consensus seems to be that the Molex connectors are better. Guess that's what happens when you jump to conclusions...:-)

After some thought, it now seems to be a toss-up between the Power Poles and the Molex...the Power Poles seem better constructed, but not readily available; the Molex, readily available but perhaps not as reliable (I wonder about the long-term ability of the Molex to withstand repeated plugging and unplugging, such as you might do over the course of several emergencies).

The choice between apparent reliability vs availability was why I gave the (slight) nod to the Power Poles in my recommendation to the EARC. The last thing you need during a public service event or emergency is to have to replace a bad connector; you'd better have the spares with you ahead of time anyway, since there won't be time to run down to Radio Shack....

I was able to find the Power Poles in Honolulu without much difficulty, although the selection was somewhat limited. I bought a couple of sets to play with to see if I could produce a configuration that would protect against accidental connection of two power sources, which was mentioned as a concern during the last discussion.

I first tried the standard "side by side" configuration, with the red connector on the right. One poster mentioned turning one of the connectors 90 degrees in order to differentiate between source and sink; I was unable to produce a workable configuration by doing this. Net result: sources and sinks cannot be differentiated; if two sources are connected, they are connected in parallel (which, as one person mentioned earlier, could be useful for battery charging).

I then tried stacking the Power Poles vertically. I arbitrarily chose red on top for sources and black on top for sinks. Again, I could not obtain a workable configuration thru a 90 deg rotation. Net result: Sources and sinks can be differentiated; however, if two sources are connected, they are connected in *shorted series*, with attendant fireworks. On the other hand, for a source to source connection to occur, you have to mate the connector so that red goes to black, and vice versa (in other words, if you check the colors before plugging away, it'll never occur :-)). If you believe in color codes, you're OK; if you want something absolutely idiotproof, this configuration won't hack it.

Comments on my experience with the Power Poles appreciated; guess I need to go back to the EARC with my tail between my legs and recommend both the Power Poles and the Molex, as there now seems to be a "dual standard" emerging, with many people saying that they use some combination of the two varieties of Molex connectors and the Power Poles.

(Would also appreciate an e-mail copy of what the ARRL Board minutes really said about the Power Poles...I no longer have those issues...tnx)

Source record: 294651

Transmission Systems Dept, 791-4409
The ICOM 2410 was on display at the Atlanta hamfest last weekend, and I seem to recall that the display was orange numbers on dark background. It looked okay and easy to read. Of course we were inside the hamfest bldg. The ICOM people had brought brand new rigs with them and gave to the dealers at the fest, to their surprise. The price was $729 to 749, (amazing how some dealers will mark up a radio to make a buck). Once dealer sold out in a few hours. (the 729 price) the others still had radios at the end of the day. Guess we will find out more when someone reviews the radio. I wanted to{ trade my IC3220 in on one but they wouldn't give me what I wanted. I understand the IC2410 can be controlled from another radio, and will allow you bring up and shut down phone patch on a repeater remotely. I can not do that with the 3220. I can bring the repeater up, but have to wait for it to drop before I can xmit again, so no phone patching using the repeat function. Any body out there bought a new 2410 yet? How about a review, specifcally, will the radio transmit crossband while receiving? tnks.

1673. TEXAS TOWERS

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-07 13:05:29 UTC
From: craigs@mcopn1.CSc.ti.COM
Message-ID: <9108071305.AA15623@tilde.csc.ti.com>
Source record: 294650

Well, with all the bad publicity Texas Towers has been getting here, and given the 11 bad stories to 3 good stories theory, guess I'll put my two cent's worth into the pot....

I live not very far from T Towers. It's basically a mom-and-pop shop. Gerald, K5GW, runs the place. Son Matt runs the repair shop, and daughter Kathryn answers the phone, checks prices, etc. A second daughter Cheryl, N5JSS, used to help out but was a victim of a disabling auto accident several years ago and is still recovering. There are a few non-family folks there as well, working in the warehouse and helping out on weekends when the store is usually more crowded. It's a phyically small operation, without really a showroom or anything, as the bulk of their business is mailorder. They are not experts, by far, just a family trying to help their father build his dream business.

While I have heard many horror stories about their friendliness (or lack thereof) and competence (or lack thereof) from both locals and out-of-towners alike, my experiences have only been good. The biggest problem is how hectic things get. Three customers easily fill the store. I've gone there during the week when they have had six or seven customers waiting for attention and three phone lines ringing off the hook! If they sound rude and abrupt over the phone, it is likely that they are in such a busy situation!

As for courtesy and service, I have nothing but good words to say. I have purchased several pieces of equipment in their store, and while their prices aren't the cheapest (I usually use AES as a barometer), I like supporting the local establishment because of the service I get. When I've had equipment problems, they have been there to help. When I took a lightning hit last spring, Gerald bent over backwards to help me get things straight with the insurance company and get my equipment repaired or replaced, even if it was equipment he didn't carry in the store! I was even offered a loaner HF rig when my TS440 went away to Kenwood!

So if you are thinking about dealing with Texas Towers, I can highly recommend them. You can even tell them I sent you....

73,
Craig Young, KA5BOU

That brings up a question that nobody has been able to answer yet - just how did Zee become the American pronunciation for Zed, which is the way it's spoken in English everywhere else in the world?

Answers on a postcard please to...

1677. Minor Geomagnetic Storm Alert Cancellation - 07 August

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-07 17:05:41 UTC
From: oler@vp.uleth.CA
Message-ID: <0094CC2F.28201EE0.9488@hg.uleth.ca>
Source record: 294656

/\

GEOMAGNETIC STORM UPDATE

CANCELLED: 16:30 UT, 07 AUGUST

/\

STORM UPDATE INFORMATION:

Geomagnetic storming has ended. Only the high latitude regions have
experienced occassional minor storming. Mostly active to unsettled
conditions have developed. These conditions should persist as activity
gradually becomes quieter.

Auroral activity has also diminished considerably and is expected to
remain mostly dormant except over the high latitude regions where some
periods of low auroral activity may be observed.

HF propagation conditions are on the rebound over the low and middle
latitudes. Generally good propagation conditions are being observed with
occassional periods of increased noise over the northerly middle latitude and
high latitude paths.

VHF propagation conditions are near normal now. There have been reports
of VHF backscatter communications from the middle latitude regions associated
with the geomagnetic storming which occurred this week. Conditions are no
longer favorable for backscatter communications on the VHF bands.

This Minor Geomagnetic Storm Alert has been cancelled as of 16:30 UT on
07 August. A return to generally unsettled to quiet conditions should be
observed over the next 24 to 48 hours.

Last week Icom told me the service manual for the infamous
ICW-2AT wouldn't be ready for 6 months.... Guess what was in Saturday's
mail???
I have no terrible need for it, however it is nice to know where
one is. Not a lot to read, (no mod info or other secrets. In fact, it won't
help at all on outaband or C-band techiques) but it does simplify the over-
view understanding if you like to (or get paid to) stare at schematics.
$20.

Hmmm, "...decoding the modulation of an ordinary house window...reflect
my penlight laser off a nearby house window and catch the backscatter...",

Why don't you just come out and clearly say that you want to listen in to
what goes on in your neighbor's bedroom?

What you propose is really a combinational audio/visual monitoring system
to study the social interactions of bipeds...Right?

;-)

1684. Why don't we CQ above 30 MHz?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-07 20:54:43 UTC
From: edg@netcom.COM
Message-ID: <1991Aug07.205443.14097@netcom.COM>
Source record: 294659

Why don't we CQ on VHF and up? I don't mean a literal CQ, though that doesn't seem like such a bad idea, but why is it that there's no particular equivalent that means "I'm here on the [frequency|repeater] and want to chat, even with somebody new."

You can say you're "monitoring" or "listening" but what does that mean? That may mean, "if anybody has any traffic for me, it's a good time to give a call." It implies that you're available to talk, but the number of times (in 15 years of hamming) that I've ever heard it elicit a stranger coming back, complete with introductions and the like can be counted on my various appendages.

So, I askya, why this aversion to meeting new people on VHF and above?

1685. Re: Converting comm radios for ham use...

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-07 20:58:11 UTC
From: brian@ucsd
Message-ID: <9108072058.AA05458@ucsd.edu>
Source record: 294657

I've been using MICORs in ham service for years, and have built many repeaters with them.

If the radio was originally tuned up between 450 and 470, it should tune into the ham band with no modifications. All you should have to do is order a receive crystal for the ham frequency, and tweak. International Crystal will make you a crystal to replace the one inside the channel element for about $12. Be sure to specify "commercial standard" grade, else you'll pay $18 or more for a "high accuracy" crystal that hams really don't need.

It's a good idea to bench-check the radio BEFORE you take the commercial channels out of it, just to make sure it's working properly. It probably is; most of those radios are being surplused because they're old, not because they're broken. They went off the Moto price list around 1982, if I remember right.

Note that the RF power transistors aren't available any more, so you may want to buy an extra radio for parts. Around here, 50 and 75 watt 450 MHz MICOR mobiles go for $50 to $100 at the swapmeet depending on condition and accessories. High-band (2m) radios are about $50 more than that, unless they came out of a railroad. Low-band ones (6m) are cheaper.

|>
|>Good DX and 73,
|>Phil KC4ZEN

The way I've heard the tale, the neophyte (hence, poorer) wire telegraph operators would attach their telegraph sounders (the click-click devices seen in the old western movies) to the lids of cans so that they could hear them better in a room with more than one operator receiving. These poor operators were called "lids" since they needed this crutch to copy. But, then again, this may be urban legend...

|>Oh, and the noise blanker is standard. It transceives with a T4X xmtr.
|>$135 sounds about right for one in good condition.
|>
|>AL N1AL

As an R4 and R4C owner, I second Al's comments. One major difference between the two is that the variable selectivity in the R4 (and R4A and R4B) is obtained by switchable LC filters at 50 KHz. This gives an easy implementation of passband tuning, but the shape factor is nothing to write home about. The R4C used a bank of switchable crystal filters with much better shape factors. Sensitivity is better than 0.5uV, and it is a nice radio overall. One possible glitch is that there is a "forbidden zone" in the frequency coverage due to the choice of mixing frequencies; if I recall correctly, this occurs around 10 MHz, so you might not be able to get accessory crystals to cover the 30 meter ham band.

[stuff deleted]

Its not really a VHF vs HF issue. If you listen to 2M SSB, for example,
you will hear CQs quite often. Its really the "FM Repeater" style that
tends towards saying things like "monitoring" and "listening". But some
people (myself included) have been known to give a short CQ on 2 Meter
FM. It seems to work.

1697. IC-W2A crossband repeat

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-08 04:39:48 UTC
From: ker@cbnewsj.cb.att.com
Message-ID: <1991Aug8.043948.152@cbnewsj.cb.att.com>
Source record: 294670

I'm attempting to use the W2A cross-band repeat function and get
the following results:

1) Whenver a signal is received on UHF it's re-transmitted on VHF
2) Whenver a signal is received on VHF it's re-transmitted on UHF

So far so good.

The problem is that it appears as if PL is not transmitted by the W2A
when in this mode.

I had VHF set to 146.595 simplex, PL 107.2, PL ON
I had UHF set to 448.875 repeat, PL 107.2, PL ON

When a VHF signal was received, the W2A would transmit on 443.875 (good) but
no PL thus preventing me from accessing the repeater.

I also repeated the above with tone squelch on.

Does anyone have any clues as to what I'm doing wrong or is this just a
shortcoming of the rig. Possibly it won't transmit PL in cross-band
repeat mode.

I did enable extended receive first as one of the mods indicated.

1702. Bad TX audio in IC-W2E

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-08 09:02:40 UTC
From: benjamin@ee.tut.fi
Message-ID: <1991Aug8.090240.26250@cc.tut.fi>
Source record: 294676

I have had my IC-W2E for about three weeks now. It's a great handie but people are complaining that my transmitted audio sounds like speaking through a tin can and the deviation is poor. I have confirmed this by listening to a fellow ham talk through my radio.

Is this typical of the IC-W2 series radios? Is the design of the case bad or have I got a defect unit?

The circuit diagram shows that the component values in the mic amplifier are different according to the model and destination. I once had a Southeast Asia version of ICu2AT and it suffered from the same problem. When I compared it with the European version back home, the latter produced much clearer audio. Maybe Icom has fouled up and my radio has been taken from a Asian version production line to fulfill unpredicted need in Europe?

Benjamin OH3BK

[International Phonetic Alphabet]

Has the IPA changed lately? My wife was sailing last weekend and heard
some marine band folks using a different one than she learned for her
ticket, and was told it was 'upgrades' recently.

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 022 (OPDX.022)
August 5, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, DL6RAI, WK3N, WB3LHD, NW8F, K8KAE, K8MFO, W8QWI and K8YSE for the following DX information.

3C0, PAGALU ISLAND (ANNOBON). A reminder that a Spanish group will be going to 3C0-land and should be active August 6th. They may be active as 3C0CW for 10 days. Operation will be on all bands both CW and SSB. They will also be operating on the WARC bands, look for them on 24950, 24900, 10105, 18070 and 18160 kHz. CW QSLs go to EA3CW and SSB QSLs go to EA3CUU.

A3, TONGA. Gee! We reported last week Ron, ZL1AMO, was in 5W-land, but now he is signing A35EA from Tonga. (He sure likes to island hop!) Length of stay is unknown. Usually you can find him on CW around 25 kHz from the band edge. QSL via ZL1AMO.

CY9, ST. PAUL ISLAND. A group from Montreal is now active and signing CY9CWI. They will be there until August 8. Activity seems to be on all bands, including the WARC bands. Operation is CW and going by call areas on SSB. Check 24940 kHz for both CW and SSB contacts. QSL via VE2CWI.

CY0, SABLE ISLAND. This was a surprise that showed up. CY0SAB was on Saturday at 2330z on 14169 kHz. Length of this operation is unknown as this bulletin was being put together. QSL via VE1CBK.

FH, MAYOTTE. Both FH8CB and FH5EJ have been active this week. FH8CB like to operate on 14255 kHz around 2300z. FH5EJ can be found on 18082 kHz around 0330Z and on 14013 kHz around 1230z or 2130z. QSL FH8CB to the CallBook address via France. QSL FH5EJ to P.O. Box 161, Mayotte Island via France.

HI, DOMINICAN REPUBLIC. HI8A is now active on 6 meters with 200 watts to a 5 element beam at 165 feet. He listens all day on 50110 kHz, even from his work QTH. QSL to Aki Nagi (JA5DQH), P.O. Box 1163, Santo Domingo, Dominican Republic.

SV/A, MT. ATHOS. RA9YD states he has been hearing SV1AI/A at 14020 at 0600z for about a week now. SV2ASP/A has been heard stateside on 21335 kHz at 1700z on the 3rd of August.

QSL CARDS IN THE MAIL. Alot of CW ops will be happy about this, the ET2A cards from the second operation are now being received. The QSLs from VP8BUB, South Georgia Island, were received (17 months). Also received HK0TU and VE8PW.

XU, KAMPUCHEA. Josef, OK1NQ, continues to be active as XU1NQ. He will stay in Pnomh Penh until August 20. It seems stateside has been hearing him mainly on 15 and 20 meters, but Europe reports some activity on 10 meters. He also likes CW and can be found between 10 to 45 kHz from the bottom of the band edge. QSL via OK1NQ.

YI, IRAQ. YI1BGD was heard on OSCAR 13 Mode B looking for U.S. on 145.8855 Mhz around 1028z and also on Mode J on 435.980 Mhz around 0653z.

ZA, ALBANIA. Well, it seems things are still go for HA0NNN and HA0MM. The equipment donated by INDEXA arrived in Germany where it was trucked to Hungary and than to Albania. The latest word is the operation will begin August 5th or 6th and last from 10 days to one month. All we can do is wait and hope by the time you read this, that they will be on the air. UPDATE: Zedan, JY3ZH, worked an HA station claiming that HA0MMM and HA0NNN are arriving in Albania Sunday morning with a license awaiting them upon their arrival. As soon as they have the license in hand, they will fax it to ARRL Headquarters and possibly be on the air Sunday evening August 4 as ZA2QA. FLASH UPDATE: As the bulletin was going to print a station signing ZA2AQ showed up for brief moment on 14025 kHz around 2045z.

ZD8DX CARDS. John, K8YSE, reports receiving a ZD8DX card. The card is a very nice picture card of a huge log periodic antenna on the island. Enclosed with John's cards was the following info: "Its is with deep regret that I must report that Dave Porter, K2BPP/ZD8DX passed away July 13, 1991. Earlier this spring Dave suffered a severe fall and broke his back in 4 places. His physical rehabilitation was going very well when he was overcome by a secondary infection. Dave's two loves were Amateur Radio and boating, and his last assignment on Ascension ranked among the best times of his life. Thank you for working Dave. It surely brought him as much pleasure as it did you."- 73's John WB2K. Dave's logs are in the computer and WB2K apparently confirms all QSO's when you send for a particular card.

Source record: 294580

[question about TX audio quality in W2E vs W2A deleted]

I own a W2A and the new HM-70 speaker mic. Believe it or not I have
better reports while using the internal mic than the external speaker
mic. The HM-70 is a FULL SIZE speaker mic- not a mini version- so it
seems odd to me that it has the worst x-mit audio of the two.

In any case both mics have good audio, no one has ever complained.
From what I have heard of Icom's manufacturing methods there should be
no difference between the versions audio wise. The only problem could
be a bad mic element- its is possible that yours could have problems.

BTW- others I know have W2A's and their audio is verry good as well.
The little speaker for rx audio..... Well thats a different story.
How good can they make a speaker to fit in a 1" dia. space anyway.

-Tim

Source record: 294584

The Yaesu FT-411E is an absolutely sterling performer, has all the bells and whistles, and can be had for under $300. If you're looking for a 2m HT, you just can't go wrong. I have two of them (actually one 411 and one 470, the dual-band version of the same thing) and I'm completly happy with them. Any of the 800 number places should be selling them for $299.95 or less. If you can't find one, call the Electronic Equipment Bank (EEB) at 800-368-3270; I know for sure they're selling them for that price.

1709. Re: CQ above 30 MHz

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-08 14:02:17 UTC
From: n2ic@cbnewsb.cb.att.com
Message-ID: <1991Aug8.140217.4943@cbfsb.att.com>
Source record: 294578

The practice of not CQing on VHF applies only to 2 meter FM.

Back in the "old days" of 2 meter FM (circa 1972), it was unusual for a community to have more than 1 repeater. Therefore, a simple statement like "N2IC listening nine four" sufficed as a CQ. There was no reason for a longer CQ - everyone in the area had their 2 meter rig (a converted GE "Progress Line", no doubt) squelched on the local ".94" repeater. Your short call brought them all to life !

Obviously, this is not the situation today. Every city has multiple repeaters (most of them underutilized). With everyone scanning multiple frequencies, a short call is easily missed. I'm not ready to advocate long-winded CQ's on 2 meter FM, but there has to be a better way to scare up a QSO !

>

As I understand it, arc transmitters (sometimes called arc
converters because they (as do our modern transmitters)
converted electrical energy (don't know if ac or dc) into radio
energy by continuously shock-exciting a tuned circuit (or series
of tuned circuits) with an electrical spark. The spark excited the
tuned circuit into oscillation at its resonant frequency much as a
bow excites a violin string into oscillation at its resonant
frequency.
Hmm, what's "near-perfect CW"? Arc transmitters generated
considerable harmonic energy, I believe; the antenna systems used
suppressed it to some degree. Also, nowadays we'd designate arc CW
as F1 emission: Once you got the arc going -- fascinating
electromechanical systems were developed to feed the electrodes
into the arc at their meltback rates, for instance -- you didn't
turn it on and off for keying, you keyed L and/or C across the arc
to shift its output frequency during key-up periods. That's where
we get the term *backwave*, also called *spacing wave* back then.
Considerable experimentation was done to determine what
atmosphere would allow the arc to operate most efficiently (and at
a high enough frequency for practical radio communication).
Alcohol vapor proved to work well for this; I believe that further
improvements were made by generating the arc in a pressure other
than sea-level atmospheric.
My reading indicates that arcs were pretty efficient--50% or
so. They were also massive, because experimentation early on
determined that the presence of a large magnetic field also
contributed to the feasibility and efficiency of RF generation
with an arc -- and much of the weight of practical arcs therefore
consisted of the electromagnets necessary to produce such fields.
I must run for now. See Hugh Aiken, *The Continous Wave* for
more about arc CW. Yes, arc generated true *continuous waves*
instead of the *damped waves* generated by *spark* -- not arc --
transmitters.

Waddaya mean "we?" On V/UHF SSB and CW, CQ is pretty common. You must be thinking about FM repeaters. Since it's assumed that a repeater has a pretty strong signal into your receiver, it's assumed you don't have to do lengthy CQ's, give your call in phonetics and so on. At least in the latter case, the assumption isn't all that valid, but that's the custom. If you want the equivalent of CQ, try "This is KM6CG -- is anybody out there?"

Perhaps this varies in different areas, but when I was active on 2M in the Seattle area (about 9 years ago, sigh), "WB7EEL listening" was a quite effective way to "meet" folks. Perhaps as the repeater ethic has tended more toward closed or cliquish repeaters, the desire to talk to new folks has died as well. Maybe 2M has just become a poorly-implemented GMRS after all...

>several hundred instead of the normal 100 hz that it should. This problem is
>not only in the display but the actual frequency being heard.
>What component went haywire ?

I also have a TS820S (and LOVE it even after 12+ years and 280 countries
:-))

I experienced the same problem some time ago and traced it to a poor or
corroded contact from the VFO variable capacitor to ground. Here in Arid
Zona the problem is fine dust contamination, in places where water is
found in the atmosphere it is likely corrosion of some sort.

THe fix in either case is the same, clean the contacts! Personally I
(still) prefer pure freon degreaser if you can get it, but ordinary
contact cleaner works well too.

I would also clean all of the plug contacts for the VFO/display etc.
just to be sure they don't give you trouble.

Source record: 294587

Actually, I know some folks who literally call
"CQ 2 meters" when they are looking for a QSO.
Mostly, the "monitoring" brings somebody (sometimes
several somebodies) to chat with. I always answer
an unfamiliar callsign when they say they are
monitoring; mostly I'll answer any such call.

I also always answer the call "Is there anybody
on frequency {around, available, etc.}". I figure
such a call is requesting information of some type
and I like to help if I can.

I will admit that when I'm out of town on an unfamilair
repeater, I don't always get a response when I try
these techniques. I'm curious too, how is the best way
to scare up a QSO under those circumstances?

>Why don't we CQ on VHF and up?

Calling CQ on a repeater is considered poor manners. Dunno why, but I suppose it's really annoying to the private cliques that inhabit many repeaters. On the repeater it's usually "AA0ET/mobile monitoring". That's a passive way of calling CQ, and as you say, may not bring many people out of the woodwork. One trick I've used is to wait for a conversation to complete and call one of them.

I've never worked FM simplex, though I suspect a few CQs have been heard there. I worked a bird on SSB during Field day, and the VHF/UHF users there use CQ. On the other hand, maybe they were all just HF weenies like me and didn't know better.

In my experience, it's a regional phenomenon. Some data points are
that I've often called `listening' or `monitoring' on a repeater on
Illinois (Chicago suburbs or downstate) and had a stranger come back
and talk to me. I've had that happen a lot, too, on long drives
through the Midwest and through rural areas in the Northeast (New
Hampshire, Maine, Nova Scotia).

Forget about ever having a stranger answer your call in Los Angeles or
New York City. Now that I'm in LA, my 2m FM rig is gathering dust --
it always seems that there's nobody to talk to (Plus, it's a safe bet
that you'll not be welcome on the repeater). A far cry from where I
used to live (in Champaign, Illinois), where I could go through two
battery packs in one evening if WD9B was running his all-night
talk-in.

Hey, Phil, I know that you've told me some interesting ideas about the
sociology of this. Care to share them with the net?

>

The Anderson connectors don't seem to be known in the UK, and I'm not sure which Molex variety you're referring to .. so I'd like to propose the 4-pin variant of the Cannon (and others) XLR connector.

This is available in metal (for strength) and plastic (for cheapness), comes in both panel-mount and cable versions, and is, I beleive, very commonly available. It can be fitted without a special crimp tool (usually solder connections) and includes a strain relief on the cable version.

I suggest the 4-pin to avoid confusion with the use of 3-pin for audio. There is a 2pin+earth which would be suitable, but it's sometimes used for mains and has a lower current capacity. There's also a 5-pin and probably others, but they're probably better used for connections (like TNCs) that need more pins.

To muddy the waters still further, I believe the UK's RAYNET emergency network has defined a standard, but I don't know what it is. Perhaps someone else does ...

I got the most responses when I first upgraded to Tech, and was signing "temporary KT". Quite a few people came back to me, just to congratulate me on the upgrade. I've also had some luck if I come on with something like "This is AA7JF portable, visiting Anytown (or "passing through Anytown", if mobile), and listening." If I'm on my way somewhere, I usually mention that. Sometimes people will come back just to ask about your trip, or tell you about the last time they were there.

> For almost any antenna one of us is likely to encounter, 1:1 works fine.
> Walt Maxwell (W2DU) discusses this in his book "Reflections" and
> does a good job of it.
>
>
This statement is a little too sweeping and you'd better read some
more of Walt's stuff. A resonant antenna whose resistance is
not equal to the transmission line's characteristic impedance
will not show 1:1 SWR, and depending upon the transmission line
length, you can be reading pure resistance if it's a multiple
of a 1/4 wavelength, and a variety of resistance and reactance at
other line lengths. (Those pure resistance points would not
necessarily be 50 ohms).

Accordingly, if you let me choose the antenna's impedance
(a combination of resistance and reactance) and an
appropriate transmission line length, I can have it show a pure
50 ohms resistance at the end of the line. Furthermore, this
could be arranged even if the line were some other characteristic
impedance.

Obviously this antenna I chose will not be resonant, but by
your lights it would be. So, 1:1 doesn't always mean a
resonant antenna--it could be a resonant *system* consisting
of an antenna and transmission line.

email your request to:

pcserver@Novell.Business.uwo.ca

You have to be able to get to an internet machine to properly route
the mail to @Novell.Business.uwo.ca Beats me how you get there from
your system. I would suggest you contact Mark Bramwell as indicated
at the bottom of the following instructions for more detail.
------------------------------------------------------------------------PCSERVER -- An email
server for MS-DOS.

Available Commands:
===================
```

SENDME <filename> Requests a file from the server.
SENDME <filename> $HEX Requests a file and the server will send it as Hex.

GET <filename> Same as SENDME.

DIR <options> Sends a list of files in the current directory.
DIR *.* DIR *.EXE DIR *.MOD

CD <options> Changes the default directory.

VERSION Displays the current version of PCSERVER with some
statistics on the installation and use.

All commands must start at the first position on the line. The server ignores the subject line in the header of the message. Only commands in the body of the message will be considered.

Example:

If you wanted to request the file called TS440.MOD from the MODS directory, you would send the following commands in your mail message:

CD MODS
SENDME TS440.MOD

This will cause two mail messages to be generated. The first message would notify you that the "CD MODS" was taken ok; the second message would contain the file TS440.MOD.

The files are also available through anonymous FTP to 129.100.22.100

>one 470, the dual-band version of the same thing) and I'm completly
>happy with them.

Several of my friends have these HTs, and another has an FT-470. In strong signal areas (metro downtowns are the classic example, or repeater sites), these radios fall down dead with intermod and front-end overload problems. This is a direct result of their very broadband front ends, which don't reject out-of-band signals but instead pass them through to the mixer. In a less hectic radio environment (suburbs, or rural) they work admirably.

In contrast, my crufty old Icom mu-2at, which is not widebanded (strictly a 140 to 150 MHz radio) has far less difficulty with overload and intermod. But I must admit that I sure would like to have all the convenience features of the Yeasu's.

So in summary, the FT-411s are fine radios if you can keep them away from aggressive RF environments. 99% of the time that's not hard.

>them up!
>
>--
> Gene Kennedy - Ham Radio Operator, N5ABI -
> gak@n5abi.hou.tx.us

My experience has been that dealers do NOT put the serial number of the
the radios they sell on the invoice. That would make it impossible to
prove the identity of the radio when it arrived. Furthermore, the
condition of any unnumbered accessories would also be difficult to prove,
though I'm not a lawyer to make these judgements. My own feeling is that
it could have been an "honest" mistake, though it's hard to believe, with
the invoice being inside the opened box. In any case, an apology
from Texas Texas should have been in order. The fact that the radio was
paid for with a check (probably an uncommon occurrence) instead of a
credit card could have made my friend a target of such a scam. There are
plenty of other dealers who can sell me radios in an honest manner.

-- Rich K1CC

PS BTW, Texas Towers is one of the few dealers that offers a "cash discount" on their equipment. Does that make them less liable for such incidents compared to a credit card purchase?

If you haven't seen the October 1987 article in Radio Electronics
"Laser Listner" you should check it out.

My own investigations indicate that you would certainly want to use
an IR laser (to reduce your chances of being caught in the act, if you're
doing this by stealth), and don't forget the protective goggles if you do
use IR.

The amount of backscatter from a dirty window isn't all that great, and will
present a formidable obsticle to reliable easedropping. However, if you can
arrange to place a small (e.g., hole punch) piece of reflective material
(like that used to reflect headlights on bicycles and such) on the window
your results should be excellent. BTW, don't forget to cover the reflective
material will an IR filter, so its presence wonlt be obvious to others
outside the building.

Good luck.

Steve

Any dual band radio will get wacked with intermod. I have used
several radios (both portable and mobile) in high usage RF
environments only to find no real difference between brands and
models. Poor paging base setups are the biggest source of intermod.
The local fire department here is in an area we nicknamed intermod
alley and thier comercial gear is rendered useless at times.
My personal choice for a dualbander portable is the Kenwood TH-75
It is full featured, small, 5 watts (with the 12 volt pack).

>In contrast, my crufty old Icom mu-2at, which is not widebanded
>(strictly a 140 to 150 MHz radio) has far less difficulty with
>overload and intermod. But I must admit that I sure would like to
>have all the convenience features of the Yeasu's.

My only complaint about Yeasu's is the inability to get them repaired
locally. I used to own a FT-727 that blew both VHF/UHF power modules
The local toy store diagnosed it and informed me it would take
4 weeks to order parts. Exactly one year to the date I finally
got my radio back in working order. When I put it in our test lab
at work I found both dead power modules and nothing else wrong.
When it came back repaired, both modules and the IF strip was
replaced (it used to have a 2 microvolt sensitivity before I sent
it off for it's one year vacation) :-(

I have several older ICOM portables (IC-02AT,04AT,etc...) and I am
very pleased with them. Local service is great, in fact I used to
have a mu-2at that someone reverse polaritied and let the smoke out
of the transistors. I was given an estimate and a delivery date and
sure enough on the date quoted and the price guessed at, it was a
functional unit.

My TS-850 fried when my linear blew up and it took two weeks to
get repaired as well.

>So in summary, the FT-411s are fine radios if you can keep them away
>from aggressive RF environments. 99% of the time that's not hard.

The bottom line, from my dollar you could not GIVE me a piece of
Yeasu gear and expect me to use it. I am sold on Kenwood and Icom!

Most of the members of our local club all run Kenwood portables and
are as happy with them as I am with mine.

This project is to learn about low signal amplification of
optical frequencies and peripherally about "detecting"
intelligeable human speech given variable vabration modes
of windows.
I do not care about to know what goes on in my neighbor's
bedroom; I am quite surprised to discover what goes on in
my _own_ bedroom.
On the other hand, I could try to interpret the modulations
off of you adam's apple when you talk -- ooooops! power
too high! sorry!

Grady Ward.

1739. Potential Major Solar Flare Warning Cancellation - 09 August

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-09 01:56:24 UTC
From: oler@hg.uleth.CA
Message-ID: <0094CD42.741D7400.12019@hg.uleth.ca>
Source record: 294602

/\

POTENTIAL MAJOR FLARE WARNING

WARNING CANCELLED

/\

09 August, 1991

ATTENTION:

Region 6757, which was a potent flare producer last week, is continuing
to decay and does not pose a threat for major flares. Region 6758 is stable
and is also not expected to produce anything more energetic than minor
M-class flares. No major flares are expected from any of the regions
currently visible on the solar disk.

This Potential Major Solar Flare Warning has been cancelled. It will be
reinstated if new regions should appear on the east limb with a notable
potential for erupting with major flares, or if any of the regions currently
visible develop into more significant centers of activity.

Consult the Daily Summary on the STD BBS for more comprehensive
information regarding the status of solar regions, HF or VHF propagation
conditions, geomagnetic activity or auroral activity conditions.

1740. The Techie Channel UNDERWAY!

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-09 02:44:43 UTC
From: flash@lopez.UUCP
Message-ID: <1991Aug9.024443.5159@lopez.UUCP>
Source record: 294616
Cross-posted to: rec.video.satellite,rec.radio.shortwave,rec.radio.amateur.misc

The LET'S TALK RADIO audio service is now officially in operation. The channel, operated by Jim Bass of Syracuse New York, is available every evening by home satellite dish, and is also available for distribution over ham radio repeaters during non commercial programming times.

Program hosts include a lot of names you will recognize, and programs are very informative. The service features programs on Ham Radio, Shortwave, Computers, ATV, and other technical topics.

Some of the regularly scheduled programs include:

TUESDAY 10-11pm EST Bill Brown, Editor 73 magazine, HAM TV report and call in show.

WEDNESDAY 9-11pm EST Ken Reitz, Colmumnist for Monitoring Times Satellite TVRO technical talk show "Information Exchange"

THURSDAY 9-11pm EST Gordon West Talk show (Gordon runs a Ham Radio school and also writes for Monitoring Times.)

SUNDAY 2pm-3pm EST HAM TVRO EXPERIMENTERS NET

Programming is now being put together for other nights, but these shows are already in place. Check nightly around 9pm.

SPACENET 3 TRANSPONDER 21 6.2 AUDIO
LET'S TALK RADIO, America's first Communications Technology Audio Service

There is an 800 number for calls.

This is like having an audio magazine via satellite. During the initial phases of the show, there are some slow periods. I was on myself tonight for about an hour just gabbing with Jim.

During the non-program hours, Jim will also be uplinking various 75 meter ham radio frequencies, which will allow some nifty experiments.

Before programming begins you will hear Y-104 out of Syracuse, an oldies radio station.

If you have a VCII, you will have to disable it in order to receive the programming. This can be accomplished in a number of ways.

I think there is a lot of potential for the new service, and if you can tune it in, do so... AND CALL UP and be on the air.

If you have an idea for your own show, now is the time to pursue it. There are about 6 hours a night to fill, and almost 24 hours a day on weekends.

Check this one out!

From: tkelso@blackbird.afit.af.mil
Message-ID: <9108090335.AA17875@blackbird.afit.af.mil>
Source record: 294607

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

Cross-posted to: rec.radio.amateur.misc,rec.radio.shortwave

I would like to know if anyone in this group has either received or knows how to recieve LANDSAT data or Weather Satelite data. I am interested in recieving images of NE Ohio. I am also interested in the legal use of this data if I am able to recieve the satelite data directly. I am not interested in the fax type weather/image data that is easily available on the amatuer bands. The data I'm looking for is the raw multispectral band imformation that comes directly from these satelites.

Since I am posting to several groups, I would perfer direct email to:
muswick@vs2.uh.cwru.edu

I will also provide any summaries of the replies to anyone who requests them.

Thank-you

In article <60950004@hpcuhb.cup.hp.com>, jimallen@hpcuhb.cup.hp.com (Jim Allen) writes:
> Mike,
>
> Just leave the old can in the chassis and
> put a new one underneath (disconnect the
> old one of course).

This is your best solution and most reliable solution.

And from: Michael A. Covington | Artificial Intelligence Programs

>You're right, you should *not* use an electrolytic capacitor that has
>been in storage for 10 or 20 years.
>
>Electrolytics can last 50 years if used regularly, but in a few years
>without having a charge applied, they break down. Which reminds me...
>I should get out all my electrolytics and charge them.

There is a way to rejuvenate these old caps - past 10 or 20 years.
Apply a 20 percent rated voltage several times over the course of several
hours. Allow the charge to die on its own. Increase to 40 percent and repeat.
Leave alone for a few days and repeat the 20 and 40 percent adding a 60
percent. Leave alone again. Repeat adding an 80 then a 100 percent.

This usually works, having restored several early fifties tv's and forties
radios.

Becareful, though I had one explode after it went itermittent. There was
enough smoke to last a lifetime.

1744. ARRL VE Examination information

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-09 06:29:51 UTC
From: ehare%arrlhq.UUCP@uhasun.hartford.edu
Message-ID: <212@arrlhq.UUCP>
Source record: 294479

AMATEUR RADIO EXAMINATION OPPORTUNITIES

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information. Email sent to 2155052@mcimail.com will be printed and sent to the ARRL/VEC. Please include your postal address in email correspondence to this address.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team are aware that you be attending the test session.

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or how to locate Amateur Radio clubs, instructors, licensing classes and/or Novice examiners in your area; please contact the ARRL Educational Activities Department (EAD) at 203-666-1541 x219. The EAD can also provide information on recommended study materials.

AFTER THE EXAM - HOW LONG WILL IT BE BEFORE MY LICENSE ARRIVES?

If you've recently passed your initial examination for an Amateur Radio license, or if you've just upgraded, please accept our warmest congratulations! Now that you've passed the test, receiving your license in the mail is the next step.
Since the FCCs current license processing time is at about seven weeks, and since there can be additional time required within the volunteer examiner system of two weeks or so allowing your VE Team and VEC (if for Technician class or higher) time to process your application, your license might not arrive for up to eight to ten weeks.
To keep your wait for that new license or upgrade as short as possible, we are taking the following steps to give you the fastest possible service.
We have begun providing our VE Teams with express OVERNIGHT mailers for the return of applications from ARRL/VEC exam sessions to us at the VEC--and we at the VEC have begun

sending our daily packages to the FCCs Licensing Facility via an express OVERNIGHT service.
We are also encouraging our VEs, and imposing the same emphasis upon ourselves, to process examination packages as quickly as possible to expedite your license.
Having implemented the above procedures, the ARRL/VEC wants your wait for your new license to be as short as possible.
If you have any other suggestions about the program, or services we provide, please feel free to contact us.

THINGS TO BRING TO THE EXAMINATION

Be prepared to bring the following items with you to VEC examinations: Your original current FCC-issued Amateur Radio license (and a copy of it)--if you are licensed; Any original Written or Code Element credit documents (CSCEs) which are currently valid; Two forms of identification (e.g., a photo-ID or drivers license and another item indicating your current name and address); A calculator (if necessary); A pen and two pencils; and, the applicable examination test fee ($5.25 for 1991 ARRL/VEC Test Sessions).

TECHNICIAN CLASS GRANDFATHER CREDIT

If you hold a Technician class license which was issued prior to 3/21/87, you are not required to take the Element 3B (General class written) examination if you can provide a copy of your FCC-license dated before that date. If your licensed has since been renewed, and if you don't have a copy of the pre-3/21/87 license, you must seek a verification letter from the FCC. To do so, write to FCC, 1270 Fairfield Rd, Gettysburg PA 17325-7245 and request a Form 1010-B Verification Letter verifying that you were licensed as a Technician class prior to 3/21/87. After you receive that form from the FCC, bring it to the test session with you in order to claim your deserved credit.

LOST LICENSES

If you have lost your license, VECs are not permitted to submit any upgrades to the FCC without a copy of your current license attached to the 610 form. In order to expedite your upgrade, you must write the FCC and request a replacement license. Since that will take six weeks or more, we recommend that you also request a Form 1010-B verification letter from the FCC which will arrive in a couple of weeks--and is legally binding license document. You may use that form as a license until your Form-660 license arrives. The original and a copy of Form 1010-B must be brought to the test session verifying that you are

currently licensed--the copy of which will be attached to your upgrade application (in lieu of an actual Form-660 license copy). To request the Form 1010-B Verification Letter, write to: FCC, 1270 Fairfield Rd, Gettysburg PA 17325-7245; indicating that you lost your license and that you are requesting that a replacement license be issued to you--also be sure to request that they send you a Form 1010-B Verification Letter verifying that you are licensed.

ACCOMMODATIONS FOR THE HANDICAPPED OR DISABLED

The FCC requires that the administering VEs must accommodate an examinee whose physical disabilities require a special examination procedure. To do so, the administering VEs may require a physician's statement indicating the nature of the disability before determining which, if any, special accommodative procedures must be used.

The VEs may accommodate handicapped/disabled examinees by administering the examination at a place convenient and comfortable for the examinee--even at bedside; for the hearing impaired the Morse code may be sent using flashing lights or a vibrating surface; for the visually impaired, VEs may read or write for the examinee; where warranted, the VEs may pause the Morse code message after each sentence/phrase, or each word, or even after each character to allow the examinee additional time to absorb and interpret what was sent--also the VEs may substitute a sending test for a receiving test where the examinee's handicap warrants.

VE Teams may need advanced notice in order to provide the necessary accommodations to examinees who require them. If accommodations are necessary, please contact the VE Team in advance to advise them of your needs.

EXEMPTION OF THE 13/20 WPM MORSE CODE REQUIREMENTS

If you are severely handicapped or disabled individual and have already passed at least a 5 WPM Morse code examination (or hold a license which meets that requirement), you may be eligible for exemption from the 13/20 WPM Morse code examination requirements. For information and applicable forms, send a SASE to the ARRL/VEC, 225 Main St, Newington CT 06111, and request our Handicapped Information Package.

A separate posting lists the exam schedule.

Source record: 294618

I use the 3-pin ITT-Cannon 'XLR' conns. They are rated at up to 15 amps
and have nice diecast cases, some with locking springs (so they will not come
un-mated by accident).
Because i have both 12 and 24-volt gear, i worked out a neat way of avoiding
mis-connecting: On the 24-volt sockets, block up the hole for the third pin
(use a nail with its head removed, and glue in place with epoxy).
Then, any source of 24 volts can only be mated with a 'sink' plug that
has had the third pin removed. 12.volt gear has all three pins on its plugs,
so no way can you plug a 24-volt feed into it. Of course you *can* plug a 12
volt supply into a 24-volt sink, but this is unlikely to cause problems,
it never has in my mobile installation, nor amongst the 100 or so people
who have adopted this scheme in our local motorsport safety comms. group;
only thing to beware of is that the 'XLR' conns are sometimes used for
AC line-voltage amongst commercial public-address companies, rock groups
etc. We paint all our XLRs blue for 12 volts and yellow for 24 volts,
nobody *yet* has plugged a DC-powered device into an AC supply...

Pete Lucas PJML@UK.AC.NWL.IA PJML%IA.NWL.AC.UK@UKACRL

1747. Origin of "lid".

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-09 11:10:34 UTC
From: scott@ecs.umass.edu
Message-ID: <14305.28a2782a@ecs.umass.edu>
Source record: 294624

The explanation I heard about the origin of the word "lid" has to do
with a ham who has a bad "fist" when sending cw. A bad cw op sometimes puts
spaces where they don't belong - so a typical message would read:
"OK FB OM SO LID CPY"
Thus, "lid" was derived from the back half of "solid". (It would have been
too complicated to describe the guy who sends TK MA instead of CQ. We should
call those guys TKMA's!)
Hi.
73
Don (K1IDF)

1748. Why dont we call CQ above 30 Mhz?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-09 11:31:12 UTC
From: pescatore_jt%ncsd.dnet@gte.COM
Message-ID: <9108091131.AA18929@bunny.gte.com>
Source record: 294478

The practice of saying "W3XYS listening .76" is really just an example of sloppy operating that became common practice. Saying " CQ from W3XYZ" is no longer and a lot more in keeping with established operating practices. Saying you are listening is kinda in the same class of operating practice as only sending the last two letters of your call. Especially, since when you say you are listening, you are really transmitting 600 Khz away!

A depressing outgrowth of this practice has been that often when a QSO ends on a 2M repeater, someone will immediately jump in and say "KA3ABC listening" rather than call they station who didn't leave the frequency.

As far as why noone wants to talk to anyone "unknown" on 2M repeaters, I have found that the same old principles apply once again: listen more than you talk. Some repeaters are built, maintained, and frequented by three or four guys, who really are only interested in talking to each other. Some repeaters are sponsored by clubs with special interests, such as DX, contests, computers, etc. Getting on one of these repeaters to talk about traffic on the interstate is not real interesting to the everyday users. There are plenty of "I95" type repeaters, with a lot of "transient" users. The 146.76 repeater in the Baltimore-DC area here is an excellent example of a repeater that is a good place to find a QSO for a newcomer or someone driving thru. The 147.00 potomac Valley Radio Club repeater is an example of one where you wont find many people interested in the weather or the driving skills of those on I95.

The microphone button really is Push To Talk, not Push To Listen. With a little bit of listening first, you can find out which repeaters are good to call CQ on and which are good to talk about certain topics of interest. Now, of course, repeaters in LA and NYC are a different story altogether!! Fuhgeddabouttit.

ham -- Writing in the sidebar on page 9 of ARRL's *The Radio Amateur's Operating Manual* (1st ed, 1966), Louise Ramsey Moreau, W3WRE/WB6BBO, said

"Ham: a poor operator. A 'plug.'"
That's the definition of the word given in G. M. Dodge's *The Telegraph Instructor* even before radio. The definition has never changed in wire telegraphy. The first wireless operators were landline telegraphers who left their offices to go to sea or man the coastal stations. They brought with them their language and much of the tradition of their older profession....

Other explanations for the origin of the term can safely be considered apocryphal. The *H.A.M.* at Harvard story is a particularly persistent myth.

The founder of the American Radio Relay League was *Hiram Percy Maxim*; his initials were HPM. At the time of the League's founding, Maxim held the call sign *1WH*. (There were no prefixes -- such as the *W* in *W1AW* -- as we know them until October 1, 1928; these resulted from the general improvement in worldwide radio administration brought about by the Washington Conference of 1927.)

After Amateur Radio was entirely shut down in the US during World War I, hams were relicensed, but no one got their prewar calls. Maxim was relicensed as 1AW. (Maxim also held one of the special licenses that allowed work above 200 meters -- that is, below 1500 kHz; can't remember if this was pre- or postwar, but I think it was *1ZM*.) As of October 1, 1928, he became *W1AW*.

From: tom@ksr.com
Message-ID: <TOM.91Aug9085116@bigfoot.ksr.com>
Source record: 294617

My guess is that the main difference between repeaters and SSB/CW is in the way that they are used. If I'm driving to work and I have my rig tuned to a quiet repeater, I leave the squelch on. I presume the signal from the repeater is quite strong, so I don't need to hear 2 minutes of CQ from somebody to know they want to talk. A short Hi, I'm here is sufficient!

On the other hand, if I'm listening to 10 meters, I don't use a squelch, and I am constantly changing frequency. So to increase the odds that I hear somebody wanting to chat, they should call for a much longer time. It's easier to say CQ CQ CQ than to say Monitoring Monitoring Monitoring 8-)

>73,
>Craig Young, KA5BOU

It's too bad that unless you know the family members on a personal
basis, you can't get decent service. While I certainly feel for the
accident victim, I would not buy equipment from them out of pity. What
with all of the excuses you've given, theirs is still no way to run a
business. I've seen places a helluva lot more crowded than Texas Towers
and common courtesy didn't have to suffer because of it. The best way
to build a business is by putting the customer first. If you're asking
me to give them a break because life has given them lemons, I say
why not make lemonaid. :-)

I would have thought someone would reply to the inquiry and maybe they did directly, but if not, here's a few from the top of my head. The RRRA machine is 146.88 MHz. Other machines with good coverage in that area are 146.79 MHz, 145.31 MHz located in Attica, NY; 146.64 MHz located near Batavia, NY; 145.29 MHz located downtown Rochester; 146.82 MHz located Canandaigua, NY. All machines in the Rochester area are open but all auto-patches are closed. If you need telephone assistance on the .88 machine, you can usually get a control operator to respond and help you.
Good luck.

State what you want (local directions, conversation, etc.) and where
you are from and, of course, your call. That usually works. If not,
you are in one of those places where the won't talk to out-of-towners
so ask if there is anyone else from out-of-town listening :-).

If it's something urgent, like reporting a serious traffic accident,
you can try the old "transmitting in the blind for the benefit of
the deaf" routine.

1758. Notes on 450MHz rcvrs frm Lynn Johnson Electronics

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-09 16:24:15 UTC
From: tomb@hplsla.HP.COM
Message-ID: <20360030@hplsla.HP.COM>
Source record: 294485

About half a year ago I bought some 450MHz "receiver modules" from Lynn Johnson Electronics (from an ad in Nuts and Volts). These are apparently from pagers, and were built about ten years ago. They are small and pretty low power. I know some other netters have gotten these and might be interested in what others have done with them. Anyway, below is my story, at least as far as I've gone so far (always more projects than time ;-) -- I hope others who have gotten these things will post their stories, too. The modules were (are??--dunno if there are any left or not) only $10 each in lots of 3 or slightly more singly. Small, low power, dual conversion, sensitive.

My main goal was/is to build monitor receivers for our club's 440 repeater: small, light, sensitive, long battery life.

First problem was recrystalling. There was a formula on the schematic that came with the receivers, but it didn't mention load capacitance. Turns out the load cap is very low--I think about 6pF. I had to play with adding capacitance across the netting trimmer to get the 10pF crystal I got to work. But it seems fine with the added capacitance. I got crystals from both International Crystal and JAN; both seemed to work OK, but International gives tighter specs, which may be important if you want to operate over wide temp range. Retuning the RF was no problem, and sensitivity is very good: quite useable below 0.1uV on both the modules I've tested so far. (Maybe I'll be able to quantify the quieting better later...)

There was a squelch circuit mod on the schematic pack. I used essentially the squelch ckt in the Motorola data sheet for the IF/detector/squelch IC instead; it seemed a bit better suited to the noise spectrum I measured for the no-signal output of the module. The module comes with no squelch connected and a nominal 1kHz bandpass filter; must be for paging tones. I removed the filter parts and used most of the holes in the board to put in the squelch; had to patch about four parts on the back of the board.

The remainder of my work on it so far is a supervisor circuit and audio amp; I want a small monitor for our repeater that will run for a long time on one battery. I found that on power-up the squelch is well-behaved: if no sig, it stays squelched. If there's a signal with reasonable quieting and the squelch is adjusted normally, it takes about 30mS from application of power till squelch is broken. So the supervisor ckt pulses power on for 100mS each second. If the receiver stays squelched, this cycle just repeats. If you adjust the squelch control to open it, or if a signal opens it, the power stays on to the module and gets applied to the audio amp (an LM386, at least

for now). Then if the squelch closes again, power stays on both the module and amp for five seconds. Times could be adjusted somewhat, but these seem to work for most repeater conversations pretty well. I could easily add a switch that would keep power on continuously if that becomes necessary. Anyway, in monitor mode the net drain is about 1mA, and that rises to about 25mA at low audio levels, all at nominally 6 volts, though there is a regulator in the ckt for the rcvr module, so running on a 9V battery (500mA-hour alkaline) should let you monitor continuously for quite a long time.

My plan is to package this in a small diecast aluminum case w/ controls and antenna connector on one end. Whole thing will be quite a bit smaller than the "micro" handhelds, with very long battery life, for about $60. Of course it's receive only (so far ;-), and single channel, but that suits my needs just fine...

73,
Tom -- K7ITM

It's possible to cover the 10 MHz ham band, but not with the band
starting at 10.000 MHz. You have to offset the band crystal frequency.
I think mine starts at 9.8 MHz or something like that. It's covered
in the manual.

>Why don't we CQ on VHF and up? I don't mean a literal CQ, though that
>doesn't seem like such a bad idea, but why is it that
>there's no particular equivalent that means "I'm here on the
>[frequency|repeater] and want to chat, even with somebody new."

In the early days of amateur repeaters, a large percentage of operators
were unfamiliar with channelized operation. You would occasionally
hear someone come on the repeater with:

"Hello CQ, calling CQ CQ CQ. This is N1AL, November One Alpha Lima
calling CQ CQ CQ. Hello CQ CQ CQ ..." etc. etc.

So "calling CQ" got a bad name on 2 meter FM.

I too have always thought that saying "This is N1AL listening" does
not necessarily mean that you wish to talk with someone.
A SHORT CQ seems much more appropriate.

Bill, KM1C, just received a note from Victor, UA2FM, with the following info:

Dear OM,

Greetings from the first Russian Private QSL-Bureau.
I offer you QSL services from Russia:
1. Addresses of U-Stns printed in Russian and English.
SAE + 1 IRC (1US) for 10.

2. Sending out your QSLs to U-Stns via local bureaus.
1 IRC (1US) for 100.

3. Getting direct responses from U-Stns.
SAE + 1 IRC (1US) for 3.

Most U-Stns prefer 1-2 IRC along with your QSL. It
makes direct reply faster. I'll mail everything you enclose
for the station mentioned.

100 percent reply from UA2.
I would be thankful if you spread this info to your
DX friends, local clubs, and DX-Bulletins.

If an amateur is monitoring several repeaters (scanning) and hears an individual they wish to talk to, the frequency (.76 for instance) could be a great help in establishing contact quickly, instead of having to search until they found the machine the individual was on. :-)

> ...Especially, since when you say you
>are listening, you are really transmitting 600 Khz away!

I always say "monitoring". There isn't much difference. One local machine I use is 2m/70cm cross band. I could announce myself on .82 indicating I was "listening" .900 and with my dual-band in fact *BE* listening simultaneously on .900 (I enjoy the benefits of frequency diversity when mobile).

>A depressing outgrowth of this practice has been that often when a QSO ends on
>a 2M repeater, someone will immediately jump in and say "KA3ABC listening"
>rather than call they station who didn't leave the frequency.

I would assume KA3ABC didn't want to interrupt, but waited politely, to announce their presence on the chance someone else not engaged in the just completed QSO desired to contact KA3ABC. If no one answered, I might call them myself!

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
August 09 to August 18, 1991

Report Released by Solar Terrestrial Dispatch
P.O. Box 357, Stirling, Alberta, Canada
T0K 2E0
Accessible BBS System: (403) 756-3008

Based In-Part from Data Supplied By
The Space Environment Services Center

SOLAR TERRESTRIAL REVIEW FOR 02 AUGUST TO 08 AUGUST

Solar activity this week ranged from low to high. The most energetic event of the week was a class X1.5/2B tenflare from Region 6757 on 02 August. The flare was located at N25E15 and was fairly well placed for producing terrestrial impacts. It was not a particularly long-duration event (33 minutes). It began at 03:06 UT, peaked at 03:18 UT and ended at 03:39 UT. A strong Type IV sweep was observed from this region (11 minutes in duration), but emissions appeared to lack a Type II. A moderate to strong SWF was observed with this flare event. A high-resolution x-ray plot of this flare event (using the GOES-6 and GOES-7 sensors) is available in GIF format on the STD BBS.

The only other major flare of the week also erupted from Region 6757 on 03 August. This event, rated a class M7.4/2N, began at 22:13 UT. The maximum x-ray flux was observed at 22:41 UT. The event ended at 22:57 UT. Radio emissions from this flare were rather weak. The 10.7 cm emissions approached the tenflare rating, but never quite exceeded the threshold. There were no significant sweeps observed from this flare either. However, this major flare was a long duration event and was capable of producing a minor interplanetary shock on 05 August.

An interplanetary shock (most likely from the M7.4 flare) arrived at 20:45 UT on 05 August and was accompanied by sudden magnetic impulses on the ground and from geosynchronous satellites. Ground-based magnetometers registered SI's of approximately 25 - 30 gammas. Satellite magnetometers recorded impulses of approximately 30 to 40 gammas. Protons at greater than 1 MeV became enhanced as the plasma cloud penetrated the near-earth environment. The 10 and 100 MeV protons remained stable at background levels. Pioneer Venus data suggests that the speed of the solar wind following the shock was approximately 650 to 750 kilometers per second with a moderately strong southwardly directed IMF of approximately 15 to 35 gammas. Minor to major geomagnetic storming followed the arrival of this shockwave.

Low and middle latitudes maintained very active to minor storm level conditions from 02 August to 06 August inclusive. A well placed equatorial coronal hole is believed to be partly responsible for this activity. Conditions have since returned to more dormant levels.

Auroral activity this week ranged from low to high. Activity was highest from 02 to 05 August, becoming moderate to high on 06 August. Despite the high activity levels observed (mostly over the high and northerly middle latitudes), auroral luminosity was not particularly high. For this reason, the extent of the observable activity was confined to the central middle and high latitude regions. No low latitude observations were noted, except perhaps over the Australian region where periods of activity were intense enough to be observed low on the southern horizon over the southern portions of the region to elevations as high as approximately 20 degrees. The activity was predominantly white, but contained some green and occassional pink content as well. Equatorward migration of the auroral oval was observed during this storm event. Periodic equatorward excursions to the Canada/U.S. border were observed on 03 - 04 August, prompting observations from as far south as Washington state, northern Oregon, Montana, North Dakota and most of the other northerly U.S. states. No auroral observation reports were received from European regions. The state of the activity over the European regions during this storm period has not yet been fully determined.

HF propagation conditions were generally fair to good over the low and middle latitudes. Noise levels increased and MUFs dropped accompanying the minor geomagnetic storm of 02 through 06 August. No significant degradation was observed except over the transoceanic circuits, particularly from North America to Europe. These signals passed through or near the equatorially-expanded auroral zone and suffered significant fading, distortion or complete loss of signal. Conditions began improving after 06 August. Rapid recovery occurred on 07 and 08 August. Conditions are now normal over almost all latitudes.

VHF propagation conditions were mostly normal throughout the period. Northerly to central middle latitudes experienced auroral-induced VHF backscatter during the local morning and evening hours during the minor storm period of 02 to 06 August. The backscatter appeared to be rather spotty in nature. Conditions have since improved and are presently unfavorable for backscatter communications.

SHORT TERM SOLAR TERRESTRIAL FORECAST

Solar activity will bottom out this week and begin to slowly climb. We have observed the decay of most of the larger active centers with the last rotation. Unless new active centers develop, the next month may be rather void of major flare events. The models indicate that another impulse of activity may be observed over the next several months. However, unless new activity centers develop (which is certainly very possible), we may have already observed the impulse of activity which has been forecasted for the next couple of months. At the present time, we expect the next several weeks of solar activity to be mostly low to moderate with fewer periods of major flare activity.

Geomagnetic activity will remain at mostly quiet to unsettled levels over the next 5 days. By 15 or 16 August, activity could begin to increase to mostly active levels. A fairly large coronal hole has been observed in the eastern solar hemisphere which could influence terrestrial activity if the equatorward boundary maintains its present position or if the hole migrates equatorward. It will be watched closely over the next week. Consult the Solar Region and Coronal Hole Maps available on the STD BBS for graphical positional information.

Auroral activity will remain mostly low over the high latitude regions until 15 or 16 August. Middle and low latitudes should be unable to spot auroral activity until after 15 or 16 August. If a terrestrial impact materializes from the coronal hole mentioned above, it should occur after 15 August and should increase high and northerly middle latitude auroral activity to moderate levels (possibly high levels over the high latitude regions).

HF propagation conditions will remain at least good to possibly very good over the low and middle latitudes for much of the coming week. After 15 or 16 August, a minor amount of degradation may be expected over the low and middle latitudes, increasing with increasing latitude. Signal paths attempting to traverse the polar or high latitude regions may suffer more significant effects (ex. possibly strong fading, distortion and increased noise). No significant degradation is expected for the low or middle latitudes.

This week is the time the Perseids Meteor Shower peaks. Meteors capable of supporting VHF scatter propagation should already be observed. The rate of the meteor shower will increase to a peak on 12/13 August. Aside from being an excellent opportunity to view the meteor shower (the moon will not interfere, thus providing a dark sky for observing the meteors), the potential for scattered VHF propagation from the ionized meteor trails should give VHF communicators an interesting opportunity at meteor-scatter communications. This meteor shower should provide approximately 50 or more meteors per hour (or approximately one meteor per minute) on 12/13 August. Many of these meteors will not be capable of supporting scatter communications. However, the number of ionized trails will be higher on 12/13 August than it has been in months. Therefore, the potential for scatter propagation will be greatest on that evening. Please report any observed VHF scattered signals to: Oler@Hg.Uleth.CA, or to: COler@Solar.Stanford.Edu. Observed communications do not have to be bistatic (two-way) to warrant reporting. Any unusual signals heard or anomalous propagation conditions on these dates (or any date, for that matter) should be reported. We thank all those who take the time to send in reports.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 09 AUGUST

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

Cumulative 60 day Solar Activity Record
Start Date: June 11, 1991

NOTES:
Left-hand column digits represent the 10.7 cm solar radio flux
obtained from Ottawa. The right-hand column describes the relative solar
activity for that period based on the average number of major and minor
flares that can be expected for related solar flux values. Plot lines
labeled with the letter "F" represent days where at least one major flare
occurred (ie. class M5 or greater flare).

1770. Need Vacuum tube sorce

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-10 03:02:00 UTC
From: AGENGCC@OSUCC.BITNET
Message-ID: <9108100310.AA28248@ucsd.edu>
Source record: 294501

I am looking for a source for 6LQ6 or 6LJ6 Sweep tubes.
They are finals in a Swan 500 I bought at a ham fest.

Thanks Gordon Couger N5QAQ

1771. FT470 hyperscan keystroke mod file

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-10 03:05:35 UTC
From: wa2ise@cbnewsb.cb.att.com
Message-ID: <1991Aug10.030535.20418@cbfsb.att.com>
Source record: 294483

copied from packet:
From: kb2jpd@kb7uv.kd6th.nj.usa.na (Adam Vazquez)
Subject: *Hyperscan for Yaesu FT-470*

From the Bench of: KB2Jpd
==========
Enhanced Memory Scan for the Yaesu FT-470
2M,70cm Dual Band Transceiver. (Hyperscan)
==========
Greetings and hello radio amateur operators.

This bulletin adds another hidden feature to the ever growing list of things
the Yaesu FT-470 can do.

The topic is increasing the functional speed of the Memory Scan using
a specific series of keystrokes on the front panel.

I wish to thank at this time, KB2JFI, for pointing out this hidden
feature and showing me the performance increase of the memory scan. I far
as I can estimate, it will go as fast as 15 to 18 memories per second.

+=+=+=+=+=+=+=+=+=+=+=+=+=HOW TO DO IT!!!=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=

Hyperscan Mode on the FT-470 by KB2IFJ
========= ==== == === ====== == ======

1. Go into Alt mode by pressing [F] 2 (Alt).

2. Press the Up or Down Arrow to activate the Memory Scan.

3. When the Scans stops on a VHF frequency on the Left Display (The
Main Band), Hit [F] VFO.

4. Press the Up or Down Arrow to activate the HyperScan.

5. To Stop the Function, Press [F] Alt.

A preliminary guess is that there is a software loop underway
in the VFO and the Memory Scan features. By pressing these sequences
of buttons, the register holding the delay count is changed , resulting
in a faster loop.

Good work, Bobby!

+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=+=

Bobbie, KB2IFJ, for playing surgeon when I told him not to.

From KB2Jpd @W2Fwd.NY.USA.NA

Note: I haven't tried or verified this, proceed at your own risk. WA2ISE

1772. Morse Code

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-10 03:52:12 UTC
From: sehrlich@helios.northeastern.edu
Message-ID: <memo.1216244@lynx.northeastern.edu>
Source record: 294502

When I was thumbing through a dictionary a year or so ago, I could have sworn I came across a chart for American Morse Code. Now, I knew there had been International Morse Code, but I'd never heard of American. When I looked back in that dictionary a year later, I couldn't find the chart.

Could someone please indulge me and either post or send me a copy of the American version. I'd love to see it again.

Tnx.

73 de N1IYD [struggling to pass the 20 WPM for the Extra!!!]

Scott [sehrlich@lynx.northeastern.edu]

1773. Re: Ten-Tec Argonaut II... Opinions? (Summary)

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-10 04:20:28 UTC
From: acm005@zeus.unomaha.edu
Message-ID: <19721.28a3152c@zeus.unomaha.edu>
Source record: 294513

In article <19312.289da590@zeus.unomaha.edu>, I write

> I notice in my copy of the Amateur Electronic Supply Fall/Winter 1990
> Catalogue a new HF rig from Ten-Tec called the Argonaut II. Wisely
> associating it with the venerable old Ten-Tec Argonaut I (which still
> gets snapped up at hamfests today), TenTec breaks through the "wide-lapels
> and lava-lamp" styling typical of their gear and offers a small, neat
> QRP package in an Icom/Kenwood-like styled case.
>
> I looked through the annual QST index in the December 1990 issue, the
> files hf_rigs and qst_prodrev on ftp.cs.buffalo.edu under /pub/ham-radio,
> but couldn't find any mention of it (and I don't recall seeing it discussed
> in this group either).
>
> Does anyone out there in net-land own one or have more information about it?
> It's a bit pricey overall ($1200, YOWCH!), but offers 160-10 CW/SSB and 10m
> FM, QSK CW, 30 memories, dual VFO's, and all the other standard modern goodies
> and puts out 500mw - 5 Watts, adjustable.
>
> I asked the AES salesman if they've sold a lot of them and if the impression
> was favorable (yes and yes, but that's what a salesman is supposed to say! :-)

Sorry for the long delay, but here is a summary of replies I received
to my query about the new Ten-Tec Argonaut II. I did say in advance that I
might summarize postings, but apologies still if this ruffles any feathers:

Paul,

I really can't comment on the new Argonaut, but I do own a Paragon, Hercules amplifier and the auto-tunner. All have performed well. The service by Ten-Tec is outstanding. The equipment is not packed, and all the boards can be easily removed - all connections are plugs. Except perhaps a RF connection or two. If you have a problem, you call the service folks and they figure out what board is probably causing the problem and ship you a new board. My Paragon, after nearly three years of service, developed a problem in the PLL. I called them up and from the symptoms I described the tech said I would need a major loop board. They sent it out that day via mail. The board comes with a 30-day invoice. You swap the board, put it back in the box and send it back to them, along with a check for $15. None of this 'we will give you a quote in three weeks' crap. Note that they send the board BEFORE you send money! And no full cost of the board and give you a refund if you send the old board back stuff either. I guess they feel that their customers are trustworthy.

Also, several months after I bought the auto-tuner, I was having a problem with it tuning correctly. I sent it back and they checked it out and sent it back, said it was fine. Well, darn the problem was still there. I called them back, and after chatting for a while, they said write down how to reproduce the problem and send the unit back. After they got it, I got a call from the service manager, Larry Worth. He said they went up, down, left, right, and any other way they could figure and they could not find a problem. I did tell them that I was powering the unit off the 12v. outlet on the back of the Paragon and Larry said that might be a problem because they had planned on having the unit plug directly into a power supply. After finding out how the unit was being used and we talked a bit about the problem, Larry said he does not feel that he can find and fix the problem, would I take another new unit in exchange? That fixed the problem. Continuing the saga of the tuner, a couple months after I got the second unit, it also developed a problem, but a different one this time. I just sent it back with a letter describing the problem. Two weeks later the unit shows up on my door step. I open the box, find the invoice to see how much this sucker cost me this time. NO CHARGE! A relay coil shorted and took out some IC's and transistors on the logic board.

I have dealt with Kenwood service and ICOM service. I will take Ten-Tec service any day of the week and twice on Sunday. Those folks understand service and will do what it takes to make you happy and will get you back on the air as quickly as possible. They are really super. So if you wonder about the service, in my book Ten-Tec beats the Japanese on service, which is suppose to be one of their strong points.

You probably did not find any info on the new Argonaut because it just came out about a month ago - a little early for the review articles. I have been looking at that little beauty myself, but, alas, the

toy budget look more like the national budget - over spent and deep
in debt, so I guess it will be a while. If you get one, let me know
what you think of it.

73, Jim, WA6SDM
holly@hpcupt1.cup.hp.com

Just had to throw this in. There is a large support/service difference
between Ten-Tec and any of the Japanese manufacturers. The people who
designed your radio at Ten-Tec are always willing to discuss a problem
with you. Also, the service department will talk you through a lot of
problems until they determine a probable bad board. They will send a
new board (I had one arrive in 2 days!) and give you 30 days to return
the old board. If the radio is out of warranty, they will send you the
new part with a bill. Everyone is important enough to have credit at
Ten-Tec (unless, I guess, you prove to be a deadbeat!). When I started
to consider buying my Paragon, I called them to ask some technical
questions. The result was a FREE service manual. Anyone received their
free TS-850 service manual from Kenwood yet???

-Keni Gianino, WB0QNA
kent@swbatl.sbc.com

If it is by TenTec, it WILL be good.

I agree that it is a bit pricey, and as such, it has priced me out of
the market.

So, I still build most of my rigs, including receivers, but use the
QRP of the 20's to the 50's as my style.

Not as neat of polished as a TenTec, but just as usable.

Hope to cu on qrp cw this winter!

de NA4G, ``Boat Anchor Bob'', an ol' CW fart .....

[Bob also writes in a followup...]

I have used most of the cw tentec stuff, over the years (century 21,
argosy, delta, triton), and have enjoyed all. The best was the delta,
but even the old century 21 was a fine cw rig. Almost anything that
tentec makes is better than the japanese stuff from the users standpoint
(CW mode and sideband). But, tentec has gotten a bit pricey for my
needs (Damn!).

It is a shame that one can't even afford the qrp cw stuff any more!

(The above all came from my dad as gifts, and when his estate was settled).
(Also, I won the delta as a door prize as a local hamfest).
(My OM was an ol' cw Fart of the highest order, who was a ham/commercial/

army operator since 1914 --- died in 85) --- and he used nothing else but tentec (except for one kenwood) --- so I do trust his liking of the tentec gear).

de NA4G, Bob Keys
rdkeys@unity.ncsu.edu

I also myself note that it is described in detail in a full-page ad by Ten-Tec on page 131 of August QST. Here are the main features:

1. General Coverage Receive 100 kHz to 30 Mhz AM, FM, SSB, and CW.

2. Transmit from 1.8 to 30 Mhz (hmmm... at the very least, it's got all 9 bands) SSB, FM, and CW.

3. Eight-pole crystal ladder IF Jones Filter (patent pending) continously variable from 500 Hz to 2.4 kHz.

4. Full QSK CW with zero beat or calibrated tone *AND* RXO for audio pitch adjustment.

5. dual VFO's, mucho memories including splits, hi-contrast LCD display with backlight, etc., etc.

6. Field Servicable to the board level with hinged chassis decks for easy access.

In summary, the features, plus neat internal design, and unequalled service from the hills of Tennessee where they speak our English (or at least a reasonable dialect of it :-) seem to make up for the rather steep price ($1200).

Thanks to all who replied.

73, Paul W. Schleck, KD3FU

ACM005@zeus.unomaha.edu

Disclaimer: I have no financial interest in Ten-Tec except to hope that it stays in business long enough to sell me a radio! :-)

1774. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-10 04:33:20 UTC
From: tkelso@blackbird.afit.af.mil
Message-ID: <9108100433.AA27571@blackbird.afit.af.mil>
Source record: 294503

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space and rec.radio.amateur.misc. This week's elements are provided below.

I call CQ on 2-meter FM. I don't go on forever -- just a couple of CQs, my call and "over". It often gets a response (though the dirty looks that sometimes come out of the HT speaker are something to behold!). When someone says they're "monitoring", I'm sorely tempted to say: "So what!"

> Ouch! Egads that penlight laser of yours sure leaves some nasty scars.
> Glad I wasn't in my bedroom.

Hum.. reminds me of the times when I was 15 or 16.. or something. Our school had an Apple //e that we maniacs hacked upon many a night after school. With permission, of course. The machine was located in physics demonstarion equipment store room.

How infinitely amusing it was to play around with the demonstration laser! You should have seen the faces of them folks next door when they were watching the red spot crawling up on their living room wall :-9 First, plain amazement.. next, reaction: "where the **** did that come from".. next, trying to locate the source of the strange phenomenon.. and of course just when they were close to solve the mystery, we turned the damn thing off..

Well, (almost) nothing to do with ham radio - so I'll shut up. Oh, those memories.. *sigh*

Luru

TO: ALL EMERGENCY MANAGEMENT AGENCIES/OFFICES VIA THE ARS
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)427-4281
RACESBUL.182 DATE: August 12, 1991
SUBJECT: PRESS - PUBLIC RELATIONS - Part 1/5
PRESS - PUBLIC RELATIONS FOR HAMS
An address by
PAUL W. GIRARD
Contra Costa County R.A.C.E.S.
Emergency Response Institute
October 27, 1990 - San Ramon, CA
The theme of the Fourth Emergency Response Institute has
been centered around the "Changing Role of Amateur Radio in the
1990's." There have been changes, and there will be more. It
isn't going to be over until the fat lady sings and she isn't
nearly in top form ... yet!
Yesterday, when the role change was mentioned by one
speaker, it brought a kind and gentle, but firm, rebuke from one
of the "elder statesmen" of the Amateur Radio community. He
reminded us that our task was to provide communications when no
other way was feasible....and that when "ham" operators were no
longer necessary, they should, in effect..."go home."
In the final analysis, when we are no longer necessary to an
event maybe we ought to fade into the woodwork.
On the other hand, maybe the Ham operators ought to openly
display a multifaceted talent pool.
We heard about the exploits of one Ham, a mechanic, who
saved the bacon of a California Department of Forestry and Fire
Protection engine crew with fuel pump problems in the middle of a
fire. We heard reports of another group of hams who fixed the
antenna system of a city in trouble. They fixed the problem
under adverse conditions, and got the city back on track.
Some newspaper editors used to have `hot flashes' when a
local ham made contact with King Hussein of Jordan, who is a ham
operator. Golly, there would be pictures and bylined stories,
and all sort of stuff.
During hurricanes, and floods, in remote parts of the world
in which local hams were active, we used to be able to pickup 5

to 20 inches of copy. No more!
(to be continued)

In my opinion that is not a subtle way of telling anything. I have read in the magazines that DJ6SI has a QSL system that is far from subtle. Those who send in two green stamps will be served first. Then come those with one green stamp, then those with two IRC's and finally those with only one IRC. All other cards go straight into the garbage can.

I don't know if this is the truth as I have never sent any cards to DJ6SI. However I find such stories very annoying. I can understand that it is very expensive to make a DX pedition but installing my station so that DJ6SI (or whoever the DX is) has someone to work has also cost me money. And I do not bill people for confirming contacts.

The reason for not responding via the bureau at all: he stated that it will cost him DM1 (about 50 cents) per card to get QSL cards. I hereby offer him the job at the local printing shop for half the price. That should leave me with a good 1000 per cent bonus...

I somehow resent this kind of people to be called radio amateurs. And please, no flaming here as this is just my personal opinion and I do not have anything against DX peditions in general.

Bulletin ID: $SPC0812

=========
SpaceNews
=========

MONDAY AUGUST 12, 1991

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* HAM RADIO ON MARS? *
======================
It has always been said that wherever Amateur Radio operators go, their
equipment is never far behind. This was evident through the numerous
"ham-in-space" missions carried on US Space Shuttle missions, the regular
amateur radio operations still taking place from the Soviet space station
"Mir", the planned permanent ham station on the US Space Station, and
now Amateur Radio has the opportunity to fly to the planet Mars!
Speaking at the Sixth AMSAT-UK Colloquium (25-28 July 1991) at the
University of Surrey, England, Dr. Karl Meinzer, DJ4ZC, proposed
that radio amateurs send a spacecraft to Mars in 1995 using technology
that they have already developed and demonstrated in the past with their
successful OSCAR series of communications satellites. The spacecraft
would support a transponder operating in the 2400 MHz band. Launch is
possible along with the Phase 3-D spacecraft currently under development
on the second Ariane-5 launch in October 1995.

* SCOPE EXPERIMENT *
====================
While amateur radio's newest orbiting satellite, OSCAR-22, is taking CCD
images of the planet Earth, plans are currently underway to include an
imager on the new Phase 3-D spacecraft. This camera experiment, called
SCOPE, is likely to come from Japan. It will have at least two lenses
(24 and 90 degree fields) to return color images of the Earth. If
possible there will be a third lens to return sky, planet and star images.
Resolution of all of these is expected to be about 750 x 580 pixels.

* DOVE NEWS *
=============
DOVE-1/OSCAR-17 came back to life shortly before 0400 UTC on Saturday.

The spacecraft is currently transmitting on AX.25 telemetry on 145.825 MHz.
The carrier, which normally shuts down for 30 seconds every 2.5 minutes
to allow spacecraft commanding on 2-meters, remained on continuously
during a pass observed here at KD2BD in New Jersey. A brief news item
transmitted by DOVE contained the following text message:

DOVE-1>BRAMST <UI>:
DOVE's third return to service should last longer than the first two. HI!
Voice development work is going on now.

* SATELLITE OF THE WEEK *
==========
The "Satellite Of The Week" feature is in response to numerous requests
for amateur satellite transponder passband and beacon frequency information.
All active amateur satellites will be covered in upcoming weeks.

Name : UoSAT-OSCAR-14, NASA Catalog Number: 20437, Launched on 22-Feb-90
Orbit : Low-altitude, circular, sun-synchronous, near polar

The primary UO-14 beacon operates on 435.070 MHz and presently carries
9600 bit/second AX.25 FSK data. This spacecraft also carries a Packet
Communications Experiment (PCE). The PCE is controlled by an 80C186
microprocessor running at 8 MHz with 4 megabytes of RAM, and uses a
AX.25 (packet) communications protocol. The PCE digital transponder
uses the following Mode J frequencies:

Uplink : 145.975 MHz (Manchester encoded FM)
Downlink : 435.070 MHz (FSK derived from an FM receiver discriminator)

Demodulators for use with UO-14 have been developed by G3RUH and K9NG.
OSCAR-14 carries some of the latest OSCAR-22 images in a .GIF format,
as well as other drawings and text information of interest to amateur
radio operators.

I can get the radio to enter cross band repeat mode but it doesn't
generate PL when in this mode.

Does anyone know how to convince this radio to use the PL encoder
when in cross-band repeat?

I've found that getting on and saying "Anyone around who wants to chat?" usually works well. Using CWisms like CQ, Q signals, or worse, HI instead of natural laughter, on a solid repeater link seems totally out of place. Ditto for international phonetics unless the other operator just can't understand the pronounciation of your call letters. Since many people have problems distinguishing Zee from Cee, it's best to follow the example of the rest of the English speaking world and pronounce Z as Zed. Note that this is *not* a phonetic, it's the correct pronounciation of the letter Z.

Maybe it has more to do with the area and local customs. A "monitoring"
or "listening" from an unknown call will bring out a rash of "Hello, this
is so-n-so with such-n-such call located in...wherever" The number of
times that I have failed to hear that on West Virginia machines I
can count on one appendage. As we say around here, "the latch key is
always out." {8-)

> -Forrest Gehrke k2bt feg@dodger.att.com

I almost posted with the same answer Forrest, but then I thought a little
more about my answer. Any line not terminated in it's characteristic
impedance *will* have a SWR other than 1:1. Depending on where on the line
you make the measurement, and depending on the type of measurement device
you use, you might *see* a reading of 1:1, but it would be false. Neglecting
line losses, any transmission line will have the same SWR at every point
along the line. However, depending on the type of SWR indicator you are
using, it's quite possible to get a false 1:1 reading on that line. If
the combination of line length and SWR are correct, a load can be transformed

to appear to be 50 ohms non-reactive at the transmitter end by the transmission line acting as a linear transformer, which is all we normally care about, but the SWR on the line will not be 1:1 because a line with unity SWR *can't* act as an impedance transformer. SWR isn't bad, incorrect presented impedances are bad. The two are not the same.

One thing we should all be able to agree on is that the frequency of minimum true SWR on the line is the resonant frequency of the antenna. At all other points the antenna will have reactance that will increase the SWR on the line. That minimum often won't be 1:1 however. But if it is, then we know that the antenna is both resonant and has a terminating impedance equal to the characteristic impedance of the transmission line. And that's a rare occurance indeed.

In the broadcast business, the 5 pin XLR is the standard power connector used on Electronic Newsgathering Equipment such as cameras, tape recorders, and portable battery lights. Sony, the dominant broadcast supplier, uses this connector on all their portable equipment. Cine and others use it on their battery belts. If you want to be able to borrow battery power from a broadcast crew in an emergency, you'd better have a cable with a 5 pin XLR on it.

>Yeasu gear and expect me to use it. I am sold on Kenwood and Icom!

The Atlanta Icom service depot is beyond question the finest service organization I have ever dealt with and I am a fan of Icom equipment in general. Yaesu has no local service depot, but they do have a national phone number answered by a real person instead of the voice mail crud used by "Kenmore". Yaesu has always been prompt with repair parts shipments for me and the price has always been reasonable. Plus their radios are so easy to fix and so rarely need fixing that I still recomend certain Yaesu models unreservedly, especially the FT470. I can't be so kind to Kenwood. When I have to play pinball wizard through

their voice mail maze to get a busy signal in their service or parts departments, *and* be charged for a long distance call instead of getting a *free* busy from Yaesu, I'm not happy. When I have to call frequently because the equipment is not reliable and requires frequent repair, I'm not happy. When the service depot averages 2 months turnaround on shop repairs, I'm not happy. When the equipment is of poor mechanical and thermal design to begin with, I'm not happy. I don't recomend *any* Kenwood VHF/UHF equipment to anyone who is not my worst enemy. Their HF equipment is better designed, but service problems remain.

An open plea to parts departments everywhere, ANSWER YOUR OWN DAMN PHONES. Every parts department should have outside lines answered by real people. It's frustrating and expensive to have to negotiate an automated switchboard system just to get a busy. If you guys want to run voice BBS systems, that's fine, but don't put them on numbers used by customers who actually need to spend some money with your company.

>my _own_ bedroom.

After the flames have died down a little, let me give you a few pointers about laser listening devices. First, you need to use a laser with high coherence. This means that HeNe rather than solid state lasers will be required. The reason is that you need stable interference fringes to get good signal demodulation. Set up your listening device as a laser interferometer with the distant window forming the reflector for one leg of the interferometer. Your photodiode detector should get strong signals from the position modulated fringe, at least a couple of volts for a normal conversation inside the room. Very loud sounds, like passing traffic, will fall outside the detector's focal point. This gives you a nice amplitude limiter for free. Unless you use a mechanical arrangement to track the fringe, loud sounds will leave "holes" in the desired signal pickup just like a noise limiter on a HF rig does. You'll still pick up a lot of outdoor sounds that will need to be filtered out of the signal, bird and insect noises will be the hardest to filter because they fall inside the voice passband.

You might try Fair Radio Sales in Lima, OH. (419)223-2196 or
FAX (419)227-1313. They specialize on used equipment dating back
to the '40s. Their catalog says they have a lot of tubes they can't
list. Depending on how speicalized the tube is, their prices are
excellent. They usually carry both used and unused.

1. No Code Techs can become MARS members as long as they meet
the basic FM requirement of 12 hours per quarter on the HF Nets.
We know there are some members that will buy a HF radio to become
MARS members. That is up to the individual whether they want to
buy a radio just for the MARS program. The other factor is this
may encourage them to upgrade to a General license by buying an
HF radio.

2. We welcome people that are really interested in the MARS
program. Helping others has a high satisfaction feeling for each
person that participates as a volunteer in any program. If you
know anyone that is interested in MARS make sure they understand
the ground rules before joining the MARS program.

Regards

Jim Jenkins, AV 879-6640

1795. re-IC-W2A service manual to Skip, NT1G

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-12 00:38:07 UTC
From: charlie@mof.govt.nz
Message-ID: <1991Aug12.123807.452@mof.govt.nz>
Source record: 294526

Hi Skip,
I read your posting re the IC-W2A service manual, & am wondering if
you could have a close look at the technical description of the VHF RF amp
to see if it mentions anything about the pass/cutoff frequencies of the low
pass filter immediately before the RF amp & also the Band pass filter
immediately after the RF amp. I want to mod one of these filters to enable
receive down to at least 70Mhz. I hope you can help as I cannot get a service
manual here in New Zealand yet.

Cheers,
Charlie T. (ZL1BQJ) internet: charlie@mof.govt.nz

1796. HELP WITH TS440S!!!

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-12 01:02:58 UTC
From: Justin_Randall_Padawer@cup.portal.com
Message-ID: <45507@cup.portal.com>
Source record: 294511

Question. My TS440s/AT generates a sidetone when activating the
"tune" mode of the built-in antenna tuner; when the rig shifts to
CW to tune, the rig makes the sidetone as if I was keying the rig with
the key (which, of course, I'm not doing). I assume this is an
incorrectly set dipswitch or a cut diode or something. Can anyone
assist me in turning OFF the dialtone during antenna tuning?
Randy Padawer, WA4FJF

1797. IC-W2A bad audio reports?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-12 02:07:55 UTC
From: ker@cbnewsj.cb.att.com
Message-ID: <1991Aug12.020755.4202@cbnewsj.cb.att.com>
Source record: 294512

A previous poster indicated he had a IC-W2E with bad transmitted audio reports. There was one reply in which the replier indicated he had no problems.

Is this true? Is everyone with a W2A getting excellent audio reports?

>of the Cannon (and others) XLR connector.
>
>I suggest the 4-pin to avoid confusion with the use of 3-pin for audio. There
>is a 2pin+earth which would be suitable, but it's sometimes used for mains and
>has a lower current capacity. There's also a 5-pin and probably others, but
>they're probably better used for connections (like TNCs) that need more pins.

There's also a connector specifically for speaker connections, which is
similar to (but incompatible with) the mains variety, with 2 pins plus a
(rather skinny-looking) earth. They also have higher current pins than the
mains ones - about the size of the pins on the standard 3-pin variety.
I used these for 12V connections around the shack,as I was already
using the standard 3 and 4 pin devices for other things, and the pins
on the 5 pin numbers start looking a bit weak for high current
work.

>To muddy the waters still further, I believe the UK's RAYNET emergency network
>has defined a standard, but I don't know what it is. Perhaps someone else
>does ...

One magazine in Australia, rather foolishly, suggested the use of standard
240V mains connectors for 12V DC work! Of course, they were shot down in
flames, but I wonder how many people followed their advice without considering
the dangers involved.

>power of the rig without doing any damage to the rig.
>
Even doubling the power of a radio transmitter -- a 3-decibel increase -- is barely significant, and *anything* you could do to a TS-530S or TS-830S to increase its output power over its designed-in limit could do little more than raise its output power more than a few tens of watts above that limit -- *far short* of a 3-dB increase. Reasons: (1) The amplifier tubes involved -- two 6146Bs or their equivalent -- are already operating right at the top of their ratings for power dissipation in that design. (2) The radio's power supply does not have enough overhead to supply the power necessary to raise the radio's ouptut significantly even if the power-amplifier tubes could take it.

There is a third reason. Those 6146Bs operate as *linear* amplifiers; that is, they way they're used, whatever you put into them comes out with relatively low distortion. Pushing an amplifier beyond its ratings for linear amplification may increase the output power as seen on a power meter, but significantly more of that power is *distortion* -- band-trashing splatter on SSB -- than when the tube runs within its ratings for linear amplification.

The TS-530S and -830S generate clean CW and SSB when used as they're intended. If you're considering modifying them just to see a bit more on your power meter, *please reconsider*.

1801. New(?) Miracle Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-12 14:42:05 UTC
From: wmartin@stl-06sima.army.mil
Message-ID: <9108121444.AA06140@ucsd.edu>
Source record: 294522

There's a Haverhills ad on page 57 of the August 5 1991 New Yorker magazine for an antenna gadget. I'm wondering if anyone out there has had any experience with this device.

The illustration shows a triangular case with a couple of wires coming out one edge. The wires go out of the edge of the ad, so one can't see if they have connectors on them, form a loop, or what. A label on the case says "ANTENNA MULTIPLIER by RodelVox. Reception Booster for VHF & UHF Television Channels and AM, FM, & Shortwave Radio Reception." Finer print says "US Patent No. 879173 and other worldwide patents." [Note: Due to blurry reproduction, it is possible that the patent number is "679173".]

The ad-text blurb reads as follows: "You won't need it if you are connected to a cable system, but if you are not you will now get TV reception that you could never enjoy before. Inside its unprepossessing housing, the Antenna Multiplier hides a small technical miracle -- an array of electronic components that literally multiplies the reception power of your TV. The Antenna Multiplier stabilizes your TV picture, eliminates "ghosts" and static, and brings in stations that were now only visible as flickers and annoying shadows. In most areas you will be able to eliminate any outdoor antennas completely, making yourself independent of bad weather interference and atmospheric disturbances. The Multiplier needs no outside power -- it gets its "juice" right through your TV set. You place the Multiplier on the television set itself, lay it on a nearby table, or hang it on the wall. And, of course, you can bid your messy and ineffctive rabbit ears, loop, rod, or dish antennas good-bye. Antenna Multiplier will not just enhance your TV reception manifold, if also vastly improves AM/FM radio reception and brings in new stations on multiband and shortwave receivers.

We are the exclusive importers of the Antenna Multiplier in the United States and can therefore bring you this outstanding TV accessory for just $29.95. But we have an even better deal: buy two for $59.90 and we'll send you a third one...absolutely FREE!" ...And so on.

The stock # is 1429A944. Haverhills phone is 800-882-3050 or 415-543-6570 and they are at 139 Townsend St., San Francisco, CA 94107. 30-day return and 1-year warranty. Shipping $5.95 for 1, $6.95 for 3 (nonrefundable).

****

OK, hype aside, I'm wondering just what IS this thing. If there's no power required, it's not an amplified antenna. The ad even implies you don't even connect it electrically, but I think that's just sloppy writing. I'm most interested in the shortwave aspects of this, and cannot figure out how any tuned antenna device can be effective at

medium wave, HF, and all the way up thru UHF. Is this a scam like the often-seen "turn your house wiring into a TV antenna" devices? Or is this some sort of tuner or resonator or what? Anyone know of the patent and what it covers? I described it as "New(?)" because I wonder if this is really a new product or if it is an old device just being newly marketed -- there have been "miracle antennae" around since the dawn of radio, I think...

"Rodelvox" is a house brand for Haverhills; they market a radio that looks to be a DAK clone under that name, among other electronic stuff. The buy two - get one free is a standard marketing ploy of theirs.

Sometimes Consumer Reports looks at the stuff these people advertise. Has their been a reference to this in CR? (I lost my easy access to CR archives in a library a while back -- I've subscribed, but not received any issues yet. I can make an effort to look up any review or evaluation if there has been one, though.)

I'm going to try to get this on the SWL mailing list/rec.radio.shortwave, the hams list/group, the video list/group, and misc.consumers. I suggest responders try to get their comments to all these fora.

>are listening, you are really transmitting 600 Khz away!
>
Sloppy operating? Are we bringing personal prejudices here now? The original question was how best to start QSO's on unfamilair repeaters. Offhand, I'd say the above post was not contributing. Sloppy operating -- I once was so sloppy and had a honored old-timer respond "What the H*LL ya listen'g too?" Never did give me his callsign. Sigh. Common practice? Gee, the repeaters in this neck of the woods are replete with "listening" or "monitoring" with maybe once a week (long shot) a call of CQ 2 meters. BTW, that is really a neat reason to not say ".76" - because you are really transmitting 600 away! Wow. Here I thought it was common practice (rats, there's that expression again) to identify a repeater by it's output frequency. Or maybe you don't use the scanning features so you might like to know where the call came from so you could respond to the caller.

>A depressing outgrowth of this practice has been that often when a QSO ends on
>a 2M repeater, someone will immediately jump in and say "KA3ABC listening"
>rather than call they station who didn't leave the frequency.
>
QSO is on-going. I've told someone to listen for me on that repeater. When the QSO ends I want to announce I'm ready to talk. So what should I do? "KA5ABC and WA5DEF (and anyone else who was involved) I've been listening to your QSO and just wanted you to know I'm tuned into 147.080 but transmitting plus 600 KHz (KCs to you old-timers) and am available now to chat with you or W5XYZ who was going to be monitoring this repeater for me. This is N5RCK. over."

>As far as why noone wants to talk to anyone "unknown" on 2M repeaters, I have
>found that the same old principles apply once again: listen more than you talk.

I was listening. Nothing to hear. That's why I was trying to scare up a QSO.

>Some repeaters are built, maintained, and frequented by three or four guys, who
>really are only interested in talking to each other. Some repeaters are

Right. If amateurs keep abusing spectrum - especially repeater pairs - with "private" repeaters; frequencies I'm not supposed to use so three or four people can form their own little self-congratulatory clique; the hobby will die or be regulated out of existence.

>sponsored by clubs with special interests, such as DX, contests, computers,
>etc. Getting on one of these repeaters to talk about traffic on the interstate
>is not real interesting to the everyday users. There are plenty of "I95" type
>repeaters, with a lot of "transient" users. The 146.76 repeater in the

>place to find a QSO for a newcomer or someone driving thru. The 147.00 potomac
>Valley Radio Club repeater is an example of one where you wont find many people
>interested in the weather or the driving skills of those on I95.
>
Well excuse me. Maybe we should petition the ARRL to print this information
in the Repeater handbook. Wouldn't want a "transient" to talk to a "real"
user would we!

>The microphone button really is Push To Talk, not Push To Listen. With a little

Gosh. Where _is_ that Push to Listen button hidden?

>bit of listening first, you can find out which repeaters are good to call CQ on
>and which are good to talk about certain topics of interest. Now, of course,

But woe to you should you actually be interested in one of those topics and
attempt to join in! I've heard more technical nonsense passed off as "wisdom"
on these "topical" repeaters than I'd care to think about (my favorite: on
finding an intermittent problem in tube gear: "yeah, I had the same thing--
just open it up and key down then push down on the tubes till you find it").

>repeaters in LA and NYC are a different story altogether!! Fuhgeddabouttit.
>
Gee, there are SO MANY repeaters those places. Surely If you just _listen_
long enough!

>73 John WB2EKK PESCATORE_JT%NCSD.DNET@GTE.COM

To those of you who've stayed this far to my long reply to a long post --
sorry about the length. I really think amateur radio is a group that in
general is willing to help bring along new-comers. But the "Don't do that
'cause I don't like it and I'm going to be smug and preachy about it"
attitude of this post really runs counter to what I believe amateur radio
is all about. I'm glad that around here when an unfamilair call is heard
we try to go out of our way to welcome the new voice. I've been in places
where I got the cold shoulder as WB3EKK decribes. I won't listen long to
that nonsense and I come away with a very low opinion of these repeater
guardians who chase away those not belonging to their crowd.

> [stuff deleted]
>The reason for not responding via the bureau at all: he stated that it will
>cost him DM1 (about 50 cents) per card to get QSL cards....
> [more stuff deleted]

This brings up an interesting point. I've heard this about several other DXpeditioners and I don't understand the problem...perhaps someone over the pond can enlighten me. In the U.S. the cost of the outgoing bureau is $2 a pound. Which is about 150 cards, or slightly over 1 cent a card, plus the cost of the card. The cost of the incomming bureau is the cost of postage only. You have to be a member of ARRL to use the outgoing bureau, but anyone can receive cards via the incomming bureau.

So what are some of the policies and costs of bureaus in Europe...I am really interested in finding out, so if some of you folks over the pond would reply, I would be interested in finding out.

It is also interesting that DJ6SI would put the one green stamp card after the 2 IRC card. As I understand it, $1 does not buy air mail stamps in DJ-land, but 2 IRC's do. But then again, the cards I have received from DJ-land managers of late have been comming postmarked from HA-land or OK-land. The notes in the envelopes indicate that this is because of costs. Guess they finally figured out what the Finn's have been doing for some time :-). One other trick I found out about, in one of my envelopes from DJ-land was cards for another ham - this has happened twice. Now I am the one that has to foot the postage :-(.

1808. Argonaut II

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-12 18:03:00 UTC
From: MOSIER%UNCG.BITNET@ncsuvm.cc.ncsu.EDU
Message-ID: <2FCA1E951BDF201A04@uncg.bitnet>
Source record: 294535

I haven't seen the Argonaut II yet but I saw the Delta II at the High Point (NC) hamfest this weekend. Very nice looking rig, but VERY long dimension front-to-back (14"). The power supply, which has a front panel dimension of maybe 4"x4", was also 14" deep, making it look a little like a square sausage, or two bricks laid end to end (and VERY heavy). The Argonaut II is only an inch and a half less in depth according to my literature, making it a very big QRP rig. Of course, Ten-Tec leaves plenty of room inside to allow easy service, so that could explain why it is a good 4 inches deeper than an Icom 735 or Kenwood 440.

I would love to have the portability and light weight of the Argonaut II, but even though I've never had the desire to buy a linear amp, I don't know whether I'm completely ready for a power limit of 5 watts. Has anyone had any experience with building a small 50-100W amplifier for a QRP rig? That way I could have my cake and eat it too - portability with power in the shack when I wanted it.

I did call Ten-Tec and ask what the Argonaut II current drain was. They said they had never sat down and measured it, but guessed that it would be about 3A on transmit (at 5 watts) and about 1A on receive. The receive current could be reduced somewhat by turning off the panel lamp and squelching the audio. The transmit current might drop to about 2A at the lowest power. So its still going to be a bit much for a small battery (such as the Quantum Ham Battery at 2100 mAh), but would run a long time off a car battery. Of course, nobody's going to backpack a car battery too far into the woods.

>there use CQ. On the other hand, maybe they were all just HF weenies
>like me and didn't know better.

Well, a lot of people might point out that a repeater is really more
for local communication than anything else. As I was taught it, "CQ"
tends to imply a more distant form of communication is required, something
more like "CQ DX". What is "DX"? For some it is the next state while
for others it is micro-island somewhere.

All of the audio reports I've received on my IC-W2A have been good to excellent.

There is a trick, though. You need to be about 3-4 inches (7-10 cm) from the radio talking into the speaker. This is done with the top of the radio angled slightly back such that you are talking into the open parts of the 'slats' where the speaker audio comes out / microphone input goes in. Doing this results in a much 'clearer' transmission. The other solution is to use the HM-70 Speaker-Microphone - it works very well (higher audio output for the same volume setting than for the internal speaker - no big suprise!).

From: tucker@eedsp.gatech.edu
Message-ID: <1991Aug12.192603.25676@eedsp.gatech.edu>
Source record: 294533

Well, I couldn't find any archived information about on-glass antennas, so I thought I'd call upon the wisdom of the net again.

I'm looking for an antenna for my new car and an on-glass antenna is one of my options. I realize that many people regard them as a compromise and a quarter-wave in the center of the roof would be better, but I'm still interested in these.

Is there a particular brand that works well or doesn't work for you? How important is adjusting the antenna after installation? And, will my rear window defogger wires mess things up (the window is almost vertical)?

Thanks for the help.

1816. 2m repeater duplexers

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-12 19:29:34 UTC
From: tucker@eedsp.gatech.edu
Message-ID: <1991Aug12.192934.25749@eedsp.gatech.edu>
Source record: 294534

Recently, I have inherited the job of repeater manager of the Georgia Tech Radio Club VHF repeater. When doing some nosing around, I found that the duplexers appear to have between 3-4 dB loss through them on transmit. That is, 20W measured at the input to the duplexers was reduced to about 8W on the output. Is this normal?

The information I have here is that they are Wacom duplexers. I am sure that they were adjusted correctly when installed, but I doubt that much maintenance has gone into them recently. Do they need periodic adjustment? Thanks for the help.

The concept of a vibrator dates at least back to the Model T Ford.
The ignition coil used one for the sparking voltage. Don't know
why they hadn't used points on the distributor.

I've always been under the impression that vibrators were used for
low-power equipment, especially receivers. For power (i.e.,
transmitters), I just don't think they can carry the current.

I just checked one from my junque box; the only spec written on
the outside is "12 volts", so that didn't help much!

The mysterious changing colors of the LCD display may have a simple explanation.

If you've got a Texas Instruments LCD calculator, take it apart. You'll notice that the display has a thin piece of film over it. You'll further notice that though they come black numbers on white background, if you flip that piece of film over, they become white numbers on a black background. The same should hold true for lighted LCD displays. So much for plastic polarizing filters.

I knew that taking calculators apart in Spanish class in the 9th grade would prove beneficial -- can't remember a thing about the material we covered.

1821. Minor Geomagnetic Storm Alert - 12 August

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-12 22:05:23 UTC
From: oler@hg.uleth.CA
Message-ID: <0094D046.D8288780.14785@hg.uleth.ca>
Source record: 294541

/\

GEOMAGNETIC STORM ALERT

ISSUED: 15:00 UT, 12 AUGUST

/\

ATTENTION:

A minor geomagnetic storm has materialized. Minor to major geomagnetic storming has been observed over all latitudes (particularly the high latitudes) since approximately 06:00 UT on 12 August.

Auroral activity has increased in intensity over the high and northerly middle latitude regions. Generally moderate levels of activity have been witnessed thus far, but appear to be confined mostly to the high and northerly middle latitude regions. Some central middle latitudes may witness activity on the evening of 12/13 August (the same time the Perseids meteor shower peaks). Periods of high auroral activity can be expected over the high and northerly middle latitude regions over the next 24 hours.

HF propagation conditions are still near normal over most middle and low latitude regions. Increased fading and flutter was observed over the lower HF frequencies (below 7 MHz) during the local evening hours of 11/12 August. High latitudes and polar regions are experiencing the most unstable conditions. Some degradation in middle and possibly low latitude propagation may be observed over the next 24 hours.

These conditions are expected to persist for the next 24 to 48 hours. Activity over the middle latitudes should remain at active to minor storm levels.

** End of Alert **

> says "US Patent No. 879173 and other worldwide patents." [Note: Due to
> blurry reproduction, it is possible that the patent number is "679173".]

A quick note on patents. Six digit patent numbers are for what are called
"Design Patents" which only cover the ornamental design of something to prevent
identical appearing clones from being made. It has *nothing* to do with
actual operation of the device. That would be covered by a "letters patent"
which would have a seven digit number (they just went over 5 million in patent
numbers). Hence, the "patent" mentioned proves nothing about the effectiveness
of the device.

Anyway, I'm sure this thing is a complete crock.

1823. MD-DC QSO Party Rules and Sample Log (*LONG*)

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-13 00:57:32 UTC
From: eab@voa3.VOA.GOV
Message-ID: <1991Aug13.005732.18378@voa3.VOA.GOV>
Source record: 294543

The Antietam Radio Association of Hagerstown, Maryland, W3CWC, will present the 1991 Maryland-DC QSO Party this summer. The contest will run from 1600 UTC August 17 to 0400 UTC August 18 _AND_ from 1600 UTC to 2359 UTC August 18.

[In other words, the contest will run from 1600 UTC August 17 to 2359 UTC August 18 with a 12 hour break from 0400 UTC to 1600 UTC August 18.]

MODES : 1> PHONE AND 2> CW/RTTY/DIGITAL

* Stations may be worked _ONCE_ per band using each mode.
* CW contacts may only be claimed if the QSOs was in the CW portion of the band.
* Non-Maryland/DC stations may only claim Maryland/DC contacts for scoring.
* Maryland/DC stations may work any other amateur station.

Portable and mobile stations that change Maryland counties [or states] during the contest count as a separate station in each new county [or state] of operation. Contacts through a repeater do _NOT_ count for scoring purposes. [Repeaters may be used to set up skeds with other stations, however.] All other HF/VHF/UHF contacts do count.

EXCHANGE: Signal Report, QTH _AND_ the MAJOR CATEGORY OF ENTRY.

* Signal reports should be in the standard "RST" format.
* QTH for Maryland/DC stations is either the Maryland county, "DC" for Washington, DC or "Baltimore City" for Baltimore City.
* QTH for non-Maryland/DC stations is either the US state or country of operation, if DX.
* Major Categories are: CLUB, QRP, MOBILE, NOVICE, TECHNICIAN, YL (XYL) AND STANDARD (for all others).
* Use only the one major category for your station.

SUGGESTED
FREQUENCIES:
* SSB: 1.860, 3.920, 7.265, 14.280, 21.370, 50.150 and 144.550 MHz.
* CW: 3.643, 7.060, 14.040, 21.115, 28.060 MHz. Suggested CW listening times are on the odd half-hour, i.e., 1730, 1930, 2130, etc.

SCORING: QSO POINTS
---
* Each simplex phone QSO counts as one point.
* Each simplex CW QSO (including RTTY/digital) counts as two points.
* For Maryland/DC stations, each QSO with a mobile station counts

as five points.
* Each QSO with a club station counts as 10 points.

N.B. The highest point value applies, e.g., a CW/mobile contact counts as five points or a CW/club contact counts as 10 points.

MULTIPLIERS
---
* Multipliers may only be counted once; _NOT_ once for each band.
* For non-Maryland/DC stations, each Maryland county, Baltimore City and Washington, DC are multipliers. -- N.B. maximum 25.
* For Maryland/DC stations, multipliers are: Maryland counties, Baltimore City, the District of Columbia, each of the 49 other US states and one for DX -- N.B. maximum 75.

BONUS POINTS
---
* Mobile stations may ADD 100 bonus points to their raw score for each Maryland county/Baltimore City/DC they work outside their home locations from which 20 contacts were made.

FINAL SCORE:
* QSO Points X Multipliers + Bonus Points = Claimed Score

AWARDS:
* High score verified for each US state, Canada or DX;
* Top three Maryland logs;
* High scoring Maryland/DC club;
* High scoring Maryland YL (XYL);
* High scoring Novice;
* High scoring Technician.

CERTIFICATES:
* For each station with at least 100 QSO points;
* To the best SWL log (N.B. Must not be a licensed amateur radio operator.);
* For the highest scoring QRP station.

The decision of the judges is final.

The committee reserves the right to issue additional awards and/or certificates if deemed appropriate by the Antietam Radio Association.

Logs should be postmarked no later than September 10, 1991 and mailed to:

Antietam Radio Association
P. O. Box 52
Hagerstown, MD 21740
USA

Attn: MD/DC QSO Party Contest Committee (Log Enclosed)

Logs postmarked later than September 10, 1991 will _NOT_ be processed.

Be sure your log indicates your complete exchange information and your major category of entry, i.e., CLUB, NOVICE, MOBILE, QRP, TECHNICIAN, YL or STANDARD.

Any questions may be directed to:

WA3EOP
Contest Chairman MD/DC QSO Party
W. Page Pyne
109 South Artizan Street
Williamsport
Maryland 21795
USA
Phone: (301) 223-8843

If you would like a complete listing of the results of the contest, send an SASE to the MD/DC QSO Party Contest Committee at the Antietam Radio Association address above.

I'm sorry, it should have read:

...(about 50 cents) per card to get QSL cards printed...

That is what the man openly tells us. What are they made of, gold?

I still believe DJ6SI *never* uses the bureau. BTW the cost of the Finnish
bureau is included in the League membership dues and if you are a member of
a local club you can get your cards at the club for free. If you want them
sent to your home address by mail the additional costs you have to cover
are just the stamps and envelopes.

I have a couple of books from the early 1930's which show vibrator-type power supplies running off 2, 4 or 6 volt lead-acid accumulators (as used to supply filament current). One of the books even recommends the use of a toroidal transformer, with the secondary tuned to the same frequency as the vibrator's reed by means of parallel capacitance; the resonant-secondary power transformer is not a new phenomenon.
Some vibrators were 'syncronous'; that is to say they had a second set of contacts that were used to alternately switch the ends of the secondary winding, so the vibrator provided rectification and saved on the cost and/or battery drain of a tube-type rectifier. Some radios used 'cold cathode' rectifier tubes (0Z2) but these are inefficient and have a high forward-voltage drop.
Theres also a diagram of a device designed to chop 220-volt DC power and feed it into a transformer for getting high B+ voltage. (quite a bit of the UK was afflicted with DC power until the mid-1940's).
Dynamotors seemed popular for higher-power systems (theres a limit to the current you can safely interrupt using a vibrating reed).
Finally, there are diagrams for 'chemical rectifiers', which consist of glass jars, a set of electrodes (lead plates and carbon rods) and a curious electrolyte of epsom salts and other smelly substances. This was the way you rectified AC line current for battery-charging in the days before selenium rectifier stacks.

Were 'vibrator' based power systems the first 'switched-mode' machines?

In a recent DX bulletin from The Ohio/Penn DX Packet Cluster, number 022, edited by Tedd Mirgliotta, KB8NW, the following entry appeared under the paragraph beginning "THE WK3N DX WORLD NEWS....":

"Croatians continue fighting in Yugoslavia for their independence! Look for a major break thru in negotiations and possible country status later this year?......"

In my opinion, this entry is deplorable and represents some elements of amateur radio as insensitive to the very real suffering and death that is taking place over a struggle between two peoples. I believe that amateur radio was not founded on the shallow principle of attaining a DXCC point, but rather on the premise that people can help others unselfishly and with compassion and contribute to a world fellowship. Should we not reflect this ideal in our behavior?

I wish to suggest that this type of writing stop immediately and that the Ohio/Penn DX Packet Cluster and Tedd Mirgliotta issue a retraction of the entry and a promise not to issue anything like it in the future.

Sincerely yours,

Rick Gaus

>kindly suggest that the folks marketing this antenna may not exactly be on the
>up and up? Could be, could be.
>
>Dave Dembeck (david.dembeck@mvs.udel.edu)

He gave me permission to post his note -- I find this most interesting.
A "feeding trough", eh? Sounds appropriate... Anyway, I'm sure about the
numbers I posted, except for the one blurry digit as noted. The number
definitely was NOT in the current range of over 4 million (as another
poster mentioned); there were only 6 digits. So either the patent numbers
are a blatant lie or a misprint or printing error or refer to some other
thing than a regular US patent.

(I wonder how many patent references on products are just made up? Sure
cheaper than getting a patent...)

It might be that the number refers to a "design patent" or some other
type of document that has a separate numbering scheme from the real
patents on inventions. This might be possible -- the patent isn't for
the real item (the electronic circuit) but instead is just for the
packaging or shape. But I have no idea if this is likely.

As more data comes in, I will spread the word...

Regards, Will

>The TS-530S and -830S generate clean CW and SSB when used as
>they're intended.

Agreed. Those little sweep tubes become really dirty if driven any harder than the already are. A much cleaner approach and one that actually gives you a noticeable signal gain is to use a small linear amplifier in the 400-600 watt range. Tubes such as the 4cx250b or several 811A will generate enough power at sufficiently low distortion to keep the bands clean. These smaller amplifiers, while not as impressive as the kilowatts, are economical in terms of power consumption and can be found at hamfests for under $150.

David's comments are true - remember that a square wave shows higher power on a meter than a sine wave does.

> If you're considering modifying them just to see
>a bit more on your power meter, *please reconsider*.
>
>73, David Newkirk, WJ1Z, Senior Assistant Technical Editor, ARRL.

Actually, it's far easier to re-adjust the calibration potentiometer on your power meter. :-) If you choose to tweak your 530/830, make sure to run a two-tone test on it after you're done. Also look at the single-tone spectrum for harmonics. The other hams on the band will appreciate it.

73, Perry / AA0ET (just a ham that shares the band with you)

>I have a bin full of war-surplus BNC connectors....

Can I have some ? :-)

>>Are they good for 200 watts PEP RF?

Marshall's "qualified yes" involves analysis of the dielectric and plating materials used in the BNC. Much war-surplus is silver plated (nothing but the best for our boys overseas...). If it looks black or yellow in places, it's probably silver plated and RF loves it. Dielectric comes in several common flavors - teflon, polyethelene, phenolic - all with different insulation capabilities. Gold-plated center pins work well and won't tarnish. If you think about it, the current limiter is the center pin, while the voltage limiter is the dielectric.

As Marshall points out, P = E*E*R = I*I*R. The VSWR is important - VSWR stands for "Voltage Standing Wave Ratio", the ratio of voltage compared to what would be present on a perfectly terminated load. So, multiply "E" above by VSWR if the load is nonresonant. I think the same treatment applies to current, but current is rarely the limiter.

If you have a dummy load and SWR meter, you could look at the SWR at low (< 5 watts) and see if it changes when you increase to 200 watts. This tests more than just the connectors, but it allows you to compare the BNC system to PL-259 or N connectors.

73, and good luck with your toys

6LQ6 sweep tubes are still fairly common. The AES catalog used to have them listed. The 6JE6C and 6MJ6 are pin-compatible. The 6MJ6 has a little more dissipation, so it might be a good replacement. If nothing else, check your local TV repair shop. The tubes may need to be matched, which may be worth the extra couple of bucks it costs for a pair.

RE: Through-glass antennas. I bought an Antenna Specialists 2M through-glass 'cellular lookalike' and was disappointed at the SWR, at least. With a known-good Bird meter, I was unable to get it below a bit over 2:1. It looked like it might be trying to resonate up slightly above the ham band (but I didn't want to try to find out, at least not with significant power ;-). WRT defrost wires: you should find an area about 2" square with no wires, near the top of the window. Otherwise, you may have (even more) problems.

Re: no-code tech, the first six months.

Several of the no-code techs I know are considering learning the code. This was an unexpected benefit of the code. There are even some that are considering 13 wpm and General.

Our new techs are a fairly polite bunch - they're new and make newbie-style operational mistakes, but they're fast learners. As far as bolting the door on the repeater, the Extras still comprise the greater proportion of lids - many have been around long enough to know better, but operate poorly anyway.

>
>I guess I need info on the "W6" bureau, even though I now live in 1-land.
>(Is that right?)
>
Info on the incoming bureau is also explained in QST, but only about once every six months. For starters, you need to get the address of the 6 area incoming bureau. Then you need to find a stationary store that sells the "proper" envelopes--and that's no easy task. They specify envelopes that are roughly 4" x 7", are manilla colored, and open in the narrow end with a metal clasp to close them. You send a couple of these, self addressed and stamped, to the 6 land incoming bureau address. They will forward them on to your incoming manager. If you're lucky, you'll get a guy like my bureau manager, who handles only "6K" calls. I send him a check for $10 and he runs an account for me. He supplies the envelopes and addresses and stamps the envelope when he sends cards to me, which is uaually about once a month. In each batch, he sends me a statement of my postage balance. When it gets low, I replenish it with another $10 check. Talk about service! I hate to think how much time the guy must spend doing this, and realize it's strictly a volunteer service. So never NEVER complain about the incoming bureau. The guys who perform this service for us deserve a lot of thanks they never get.

1839. A Poor Man's Spectrum Analyzer

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-13 17:07:02 UTC
From: perry@hpfcdc.HP.COM
Message-ID: <39910117@hpfcdc.HP.COM>
Source record: 294439

A recent post about tweaking a Kenwood 830S for more output power was followed by my suggestion to look at the result on a spectrum analyzer. It then occurred to me that not everyone works for HP or otherwise has spectrum analyzers available to them. Let's face it - if the equipment is too expensive or the procedure too complex, most hams won't do it.

The question them becomes: "what can a ham of modest means do to ensure he's putting out a good signal ?" I then considered that many of us have general coverage receivers. Perhaps it is possible to connect the transmitter to a dummy load, pick up RF via capacitive coupling, run it through a step attenuator and into the GC receiver. With the attenuator set to produce S9+40dB at the fundamental, The GC's S-meter could then be used while sweeping through the frequencies of interest.

Has anyone ever tried this ? Is an S-meter accurate enough to measure the 40 dB harmonic attenuation required of most transmitters ? Is the typical 800 Hz CW filter too wide to measure a harmonic spike ?

Yours for more "linear" amplifiers,

Perry Scott

1840. Radio Shack HTX-202 2-Meter HT

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-13 17:39:48 UTC
From: sdkuo@argo.acs.oakland.edu
Message-ID: <8946@vela.acs.oakland.edu>
Source record: 294550

Today I stopped by Radio Shack and the manager was just unpacking the new 1992 catalogs. Looking on page 68 several new products including the HTX-202 2-meter HT is listed. This new HT seems to have the following features:

o 12 memory channels, one call channel, and 3 priority channels
o Subaudible tone encode and tone squelch
o DTMF dialer and DTMF squelch
o Ni-Cd battery pack and charger (you provide the batteries, uses AA cells)
o High-low power setting
o 5 watts when used with 12 volts
o claims to have "highly selective receiver fights intermod and front-end overload"
o List price $259.95

Other new products include:

Handheld Speaker/Microphone - Icom/Yaesu compatible, price $19.95
5/8 Wave 2-Meter Mag Mount - Nothing special, just a plan 5/8, price $37.95

From the looks of it RS is trying to gain some of the amateur radio market. On the same page as the HT, the catalog says "You must have a current FCC amateur license of the appropriate class to transmit with the HTX-101 and HTX-202". Next to the HT ad there is some info on obtaining an amateur radio license and mentions the no-code tech class. It will be interesting to see how RS will handle sales of these units. The impression I get when I walk into a RS is SELL SELL SELL. We shall see..

Well, being a Radio Shack sales person myself, I refuse to sell those to
anyone who does not hold a license. However, from the asking around that
I have done, I have found that I am one of the only ones. The Radio Shack
amateur staff is rather well rounded (in Fort Worth - ie those responsible
for this product) in their sense of responsibility, but rather short
sighted in their assumtions in regards to commission hungry sales people.

Source record: 294548

Uh-oh! My age is going to show! Vibrators were around for many years and in industrial two-way mobile radio gear until the mid-to late '60's - possibly early '70's. Transistorized switching power supplies killed them - economically and efficiently. Dynamotors were an alternative. The most powerful vibrator power supply unit I can recall was a dual - synchronous vibrator unit powering a 100 watt (output) VHF unit. Thirty and sixty watt vibrator power supplied units were fairly common. Motorola and GE, among others, at one time or another manufactured such equipment.

As far as carrying the current, the dual synchronous vibrator power supply that GE made could run a 100 watt output transmitter although 60 watt vibrator units were more common. As I recall the design, there were two transformers and one vibrator per transformer. When in transmit mode, the transformer outputs were paralleled by a relay arrangement. The low voltage sides ran continuously; avoiding having to switch large 12 VDC currents as was the case with dynamotor supplies which used starter motor solenoid relays in the primaries. With compensation for power supply inefficiencies and transmitter inefficiencies, these vibrators switched about 20-25 amps total or 10-12.5 amps at a nominal 12V DC each. That's about as good as they got in my memory.

Pros & Cons vibrators -vs- dynamotors?? Vibrator power supplies were desireable because they ran quieter and did not pose such a tremendous surge on the car's electrical system when starting them - like a powerful dynamotor did. Vibrators seemed to work best at low (30 watt) to moderate (60 watt) power levels. As a result, there were many hybrid vibrator - dynamotor supplies (my preference at the time, and the most frequently encountered configuration for 100 watt output units) -- vibrator for powering the receiver and dynamotor for the transmitter. I do not recall any dynamotor-only supplies in this era as far as industrial gear was concerned - only military gear. People did not like listening to the high pitched whine of a continuously running motor in the trunk of their car. In a tank or airplane, it didn't matter!

Then there was the dual dynamotor (parallel primaries, series secondaries) powered 250 watt output 42MHz mobile rig.....vacuum tubes had amazing resiliency for short periods of time back then.....but that's another story.

I bought my ICOM HT during the 7 weeks I had to wait for my license to show up. I wanted to have it before then so that I could have a chance to listen in on some of the local repeaters, maybe even get to know some of the methods used by the local folks. Having that radio before my license showed up gave me a lot more confidence when I DID finally get my license, as I already "knew" the people to whom I was speaking when I finally spoke!

If I had tried to buy that HT from friend EVENSONG here, however, he would have refused to sell to me (no license, after all!), I never would have had those extra weeks of listening in, and I would have been exceedingly mike-shy for the first month or so.

I would respectfully suggest that, instead of not selling to somebody without a license, first point them at the many copies of "Now You're Talking" that I understand RS has gotten in, tell them the wonderful things that amateur radio can bring them, give them literature about local ham clubs, etc. If they don't seem to give a damn about this extra information, then maybe I'd think about not selling the radio to them. But don't deny somebody who is truly interested the opportunity to listen in on a very new world...

If the patent doesn't indicate anything technically different why isn't
it to be expected that the wires going off the edge don't just connect
to the power line through a small capacitor or VHF highpass filter?

As far as I know, using the power lines as a "built-in" antenna has
been around for years both as an idea and in a multitude of products.
As far as competing with a good outdoor antenna I don't think it has any
hope at all but as previously noted hype is what marketeers get paid
for. It may still work better than rabbit ears in a room shielded by
wall insulation which has metallization as part of its moisture/vapor
barrier.

Message-ID: <0094D10C.271557E0.15961@hg.uleth.ca>
Source record: 294567

/\

GEOMAGNETIC STORM ALERT

CANCELLED: 20:00 UT, 13 AUGUST

/\

ATTENTION:

The minor geomagnetic storm of 12 August has ended. Geomagnetic activity has become increasingly dormant over the last 12 to 18 hours. It appears as though the disturbance which produced this minor storm has ended.

There is no clear solar source for the disturbance which was observed on 13 August. The Space Environment Services Center analyzed the historical data and reported that this disturbance has recurred to some extent over the last five solar rotations. This would seem to indicate an unusually long-lived source. Despite this, the source of these disturbances has not been accurately determined.

Geomagnetic activity should remain mostly unsettled to quiet over the next several days. The Minor Geomagnetic Storm Alert has been cancelled.

** End of Alert **

1855. Re: Vibrators.

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-13 22:28:16 UTC
From: holly@hpcupt1.cup.hp.com
Message-ID: <73190030@hpcupt1.cup.hp.com>
Source record: 294398

Part of the question was how. The vibrator had a set of contacts that switched the DC to one side or the other of the primary of the transformer. The transformer primary was center tapped. This alternating of current in the primary is what produced the changing field for the secondary. On the secondary, the normal rectifier, filter section existed. Some vibrators were 'syncronos' - they had a set of contacts the rectify the secondary current, hence no tube rectifier.

As can be seen from the design, if any sort of significant power was required, the primary current became very large and the life of the contacts became a real issue. Therefore the vibrator supply was limited to receiver and small (10-20 watts) transmitter duty. The larger transmitters were powered by the dynomotor.

I can remember back to the mid-to late forties and the radios in the late 30's cars all had vibrators. By the late fifties the vibrator was pretty well dead because the transistor was on the scene.

I believe that someone needs to review the frequency band authorizations.
21.115 MHz is most definitely in the Novice band.

Anyway, those are clearly marked as suggested, not required or even
recommended.

Speaking of vibrators used in radio equipment brings back a lot of nostalgia. From memory I'll attempt to target some dates, but someone having a set of the green "Rider" manuals will be able to answer accurately the question as to when vibrators were first used in radio. For the most part, vibrators were used in low power applications.

of A dynamotor was first used in car radios for developing HV in the '32-'40 era. But, the use of a vibrator dates back to the days prior to 1900. Some farm (rural) radios used vibrator power as well during this period as well.

of The first vibrator used in a car radio that I saw was built like a rocker or teeter-totter with two coils mounted below and all was mounted in a 5 inch square box with cover. The year was '44, but the car was a 1939.

of Plug-in vibrators were available in '46 after WWII where many were used in military equipment. I suspect that plug-in vibrators were used in car radios prior to 1941.

of The vibrator remained in use to power tubed equipment until replaced by power transistor switchers about 1957. Several manufacturers developed vibrator substitutes which used two transistors and a small toroid feedback transformer. All was installed inside of a vibrator can and was plug compatible with a vibrator. The reliability of the transistorized device far surpassed the vibrator.

of Transistor switchers were developed and used with radio equipment until HV was no longer required (about 1968). High Pervience (sp?) tubes were introduced in 1958-59 which operated (heater and B+) from a 12 volt supply. These tubes were used almost exclusively in car radios up until about 1965.

Reliability of the early vibrators left a lot to be desired as the contacts would burn beyond repair. Contact filing was a common occurrence. Also, the reed spring would fracture causing a total failure. Coupled with the vibrator was an 0Z4 rectifier tube which after a number of hours would fail to ignite when cold. It was then necessary to snap the power switch several times to jolt the gas enough to start conduction. In addition, a tired vibrator would fail to start and it was necessary to impart a well planted boot to the radio to get the vibrator's attention (Listen for the buzz sound of the vibrator). One could almost troubleshoot a car radio by listening to the sound of the vibrator. A high pitched sound meant a bad 0Z4 (no load condition), an erratic buzz meant either a bad vibrator or a shorted electrolytic capacitor.

After WWII, hams bought up dynamotors such as the PE-103, DM-35 etc., for powering mobile rigs. All worked very well but required a very substantial battery and charging system. Many hams installed Leece-Neville alternators for

charging their batteries. Some of us continued using vibrators to keep the battery drain under control, and that meant low transmitter power. Achieving 20-30 watts using a vibrator supply was not uncommon.

Oh! How I can remember those dual and quad vibrator supplies!

> industrial two-way mobile radio gear until the mid-to late '60's - possibly
> early '70's.

My first access to 2-way radio equipment, when I was 12, was with the new
radios purchased for the local fire department. Both fire trucks were equipped
with GE Progress Line 60watt output low band units; one had a 12 volt system
and one had a 6 volt system. This was in 1957. Power required on transmit
was 24 amps (12 volt) and 48 amps on 6 volt. Except for the filaments which
directly operated off the battery on the trucks, all current went through
the dual vibrators.

(stuff deleted)

> Pros & Cons vibrators -vs- dynamotors?? Vibrator power supplies were
> desireable because they ran quieter and did not pose such a tremendous surge on
> the car's electrical system when starting them - like a powerful dynamotor did.

Also, the dynamotors weighed a lot which was somewhat a consideration when
lifting the radio unit in and out of a trunk.

(stuff deleted)
Also, as an aside, the dynamotors took a second or so to come up to speed and
to deliver the normal plate voltage to the transmitter tubes. Police agencies,
about the only ones who could afford the early radios, were loosing the first
syllable or two from their mobile units. The familiar "10" code was developed
so that even if the "10" was lost at the beginning of a mobile's message, the
important stuff still came through after the dynamotor came up to speed.

Brian -
Gimme a break. I'm just delivering the information. If you have a problem with the "suggested frequencies" contact Page Pyne, WA3EOP.

The frequencies listed are ONLY suggested frequencies. Any contacts made. regardless of license class, will be eligible for an award.

Also, I think the editorial comment about the "nastygram from the FCC" was inappropriate and senceless.

73 and good luck in the contest

As the last country in Europe (except for Albania), I now looks like
Norway is going to have a codefree tech. license. At the General Assemblly
of the Norwegian Radio Relay League, the Telcomm.Adm. stated that a proposal
was in the "pile". They assumed the first examination for this new
class will be held in April 1992.

This new class will hold the prefix LD, and will have access to 144MHz and
up. They will also be able to hold an LB-license (current Novice-class
CW only, 15W power limit, all bands) at the same time. This gives us
a three-stage approach to the LA class.

==========

NEWCOMER'S GUIDE TO AMATEUR RADIO EQUIPMENT

I recently overheard two fairly new-to-the-hobby Amateurs
discussing (bemoaning) the high cost of Amateur Radio gear,
specifically HF transceivers. They were discussing top
brands, and top-of the line models. (Sorta like two
teenagers with newly-earned learner's permits, bemoaning the
prohibitive costs surrounding Porsche 924's...) "You really
can't get much for under $1,000," said they. "Horse-feathers!"
sez I.

Many new Amateurs mistakenly assume that they have no choice
but to begin with a tired old used QRP CW transceiver, a wire
dipole antenna, and perhaps a used handheld rig for VHF/UHF.
This may be the case if you're simply flat broke and have no
way to raise cash for a decent station, but there are many
possibilities if you allow you creativity, determination, and
logic to prevail. And you won't have to "homebrew" your entire
station (unless you want to)!

Over the past 10 years, there has been a virtual explosion in
electronic technology. The technology of "yesterday" (tubes,
and linear VFO's) have been replaced with ultra-sophisticated,
computerized, marvels of engineering and packaging technology
(for which, we pay most dearly). But let's look seriously at
some of those "antiques" of the late 70's and early 80's (which
are now in the $400 - $800 range). Did they work? Most
assuredly. How well did they work? Many a DXCC and 5 band WAS
earned, with untold millions of hours of enjoyment, to boot!

Unfortunately, newcomers won't find ads for the "antiques"
in today's Amateur Radio mags. All they see are the ads for the

new, (multi) kilo-buck transceivers from Japan Inc.

After reading some of the spec sheets on the new rigs, a newcomer to the hobby will probably think I'm off my rocker when I say most of the "features" found on the new HF rigs in the kilo-buck range are USELESS!

Just for an example, lets talk about "digital VFO's" and "memories". A "digital VFO" is in actuality, a frequency synthesizer. Synthesizers are characterized by extreme frequency stability (a very desirable trait), on the order of 20 Hz or less per hour (based on thermal changes in the crystal time base). But let's look at some of those "antiques". They, too, can boast of frequency stability. Like 100 Hz or so per hour. "But," you say, "that's FIVE TIMES WORSE than what a new rig can do!" And you're absolutely correct. But the key question is: "Will you notice 100 Hz per hour drift?" Using a tight CW filter, yes, you would--after perhaps a FULL HOUR QSO. On SSB, you'd probably want to touch the frequency knob after about 2 HOURS of rag-chewing! Yes, those older rigs sure made Amateur Radio operating rough...

"But the new rig offers 100 "memories", while some of the "antiques" don't even offer a digital display!" Yup, you're right again! But remember, unlike the VHF/UHF FM spectrum, HF is not "channelized". HF stations will be scattered randomly on the band--NEVER will you find them exactly where you programmed your memory for yesterday!. Net operation?? "Plus or Minus QRM" is often heard on many an HF net preamble. Your HF "memory" will NEVER get you exactly on the frequency of your favorite net. You'll always be tuning up and down the band anyway. Unless you plan to make heavy use of autostart RTTY, HF packet, or AMTOR, I doubt you'll ever need a memory on HF.

Keyboard entry of frequency? Perhaps good to get you in the desired band segment, but not much more.

Digital display? Impressive to look at, and perhaps nice to have. But crystal calibrators (about $20 to build, if your "antique" doesn't already have one built in) and mechanical displays have been the frequency reference for years--and yes, the new rigs' high-tech synthesizers have to be calibrated against WWV, just like the $20 calibrator...

Solid state finals versus tubes. No doubt about it, tubes are getting more difficult to find. But they CAN be found. "Tubes are expensive!" Yes they are--but YOU can replace them. Ever try to get 4 matched RF type transistors? Ever changed a set mounted in a heat-sink buried within the bowels of a tightly packed maze where even Japanese-sized fingers fear

to go? More likely than not, the average Amateur wouldn't even ATTEMPT to replace the finals in a solid state rig (IF he could find a matched replacement set!), while changing a tube presents little, if any, problem. Tubes have other advantages, too. They're infinitely more forgiving when it comes to that "ideal" 50 ohm resistive match we Amateurs are always seeking, but seldom attain. At 2:1 SWR, a tube will work just fine--a newer rig will probably go into a limited "foldback" to protect the transistors. Three to one?? Tubes are still perkin' along...Transistor? Forget it!

One disadvantage though: You will have to learn to peak the grid, and dip the plate. Hand-eye coordination. Watch the meter--twist the knob. Yup, those "Amateurs of olden days" sure had it rough...

Speech compressor? Some DXers swear by 'em. Most rag-chewers swear AT 'em! If you need one, they exist as after-market devices for the older rigs, not to mention the "build your own" method.

Suffice to say, a lot of the features on the newer rigs amount to high priced, useless frills.

What newcomers in quest of a good HF rig REALLY need to do is seek out an EXPERIENCED Amateur who has knowledge about the older rigs. Ask what kind of rig they use. Ask what they like or dislike about it. Most Amateurs are delighted to show off their shack, and give you hands-on exposure to their setups.

I'd recommend any of the following, as they were the "standard of performance" in that "classic" age of 10 or more years ago. Most can be found in ham-fests or in trader publications for around $200 - $600. Collins KWM-2A, Drake TR4-C, & TR-7 transceivers; Collins S Line, Drake T4C, R4C (separate Receiver & transmitter). Again, these were the "Cadillacs" of 10 or so years ago. Solid, proven performers, and parts still readily available.

Be cautious though--not all the rigs in this era were gems. Although some of their rigs were winners, manufacturers such as SWAN, National, EICO, et al., have had models that left a sour taste in the Amateur community. Until you're more knowledgeable about the ins and outs of specific models, stick to the "Cadillacs" like Collins & Drake.

Got a little more to spend? Icom 745 (my current HF rig), Kenwood TS-830, TS-430. $600 - $800 range. SOLID performers (even if they ARE transistorized!).

Just for fun, let me play devil's advocate. Lets assume that you, Joe New Ham, just HAS to have that kilo-buck+ special. It's a steep price to pay, no argument. But the thing you have to

keep in mind is that the cost of this hobby is mostly "up-front money." In the long run, Amateur Radio is NOT that expensive when you look at dollar cost versus hours of enjoyment.

Let's compare it to some other hobbies: Bowling--pretty inexpensive, eh? After you buy your equipment (about $75 or so), you can look forward to dropping an additional $10 or so every time you visit the lanes for a couple hours of fun. A couple times a week, over the course of a SINGLE YEAR, you've already paid MORE than that new transceiver costs! Do you enjoy going to the movies? Add this up: $5-$6 admission, $2-$5 for refreshments, that's $7-$11 per film, and if you go just once a week it works out to $350-$550 per year...add a date and double it...about an hour and a half of entertainment each week for perhaps $1,000! And don't forget the hassles of parking, waiting in line, etc. What abou golf? You pay greens fees, and you're limited to daylight and (for all but the fanatics) fair weather. Not so with HF Amateur Radio. Twenty-four hours a day, rain or shine, you can sit down and enjoy your INVESTMENT, making new friends, learning about faraway places, and perhaps helping others in life-threatening situations.

Compare your Amateur Radio hobby. Say you spend even $5,000 on a transceiver, antenna, tower, tuner, power supply, coaxial cables, rotator, and miscellaneous accessories for the shack. Let's say the setup lasts five years (conservatively) before you want to make any major changes. Five grand works out to $1,000 a year, or $20 a week for unlimited hours of operating and providing a valued public service. Even if you add more extras, like a good keyer, handheld VHF radios, club dues, magazine subscriptions, reference books, tools, license upgrade preparation tapes, packet TNCs, backup power generators, mobile gear, and a cheap computer, it's still a fairly inexpensive hobby over the long haul. No to mention the fact that you'll probably recoup 30-50% (or more) of your investment if you decide to sell your equipment used at a later date. So, for a net outlay equivalent to maybe $10-$25 a week, you can be a "compleat Amateur."

If you're still doubtful about the hobby, seek out an experienced Amateur to consult and/or go shopping with, and go for one of the "classics" of recent time. Get on the air. It won't take you long to become hooked on HF operating. It's day and night compared to VHF repeater operation. Besides, you'll always be able to sell it at a hamfest if you ever lose interest. But if you're convinced that Amateur Radio is for YOU, then go ahead and look at those kilo-buck+ specials, visit your friendly Credit Union if necessary, and GO FOR IT!

In the UK, you have to be a member of th RSGB, however, once you have become a member, the QSL bureau is _FREE_ (unless they've changed their policy from when I was a member).

To receive cards, you don't need to be a member of th society - just send in your SAE's (stamped-addressed-envelope's).

Nice, eh?

Re CQ on VHF.

The way it was explained to me, the convention of calling CQ or not doesn't depend on frequency, it depends more on the type of operation. On non-channelised operations, typically cw or ssb work no matter what frequency, you need to call a long, and easily identifiable call so that people randomly tuning the band have a chance at stumbling across you and making the connection. Anyone who hears the word 'CQ' or gets a call repeated more than once knows there is a fair chance that you are looking for a new QSO. The standardness of the calling procedure makes it easy to pick out even when tuning quickly and getting only a fraction of the phrase (or you can recognise the repetative pattern even if you are a Khz or so off frequency.)

And our HF and VHF weak signal work have a different orientation too. Since we never know what the propagation is going to be, we go into the exercise planning on casting our 'net' and taking whatever, or whomever, comes. We expect to talk with a stranger that we may never meet again.

VHF FM operation in contrast is channelised. If you are on the local repeater, about 200 milliseconds after you key your mike everyone in town will know you are here. No need to call CQ, everyone who is likely to hear you is here, and listening right now! All they really need to know is your call, and maybe a quick indication of your interest. "WB2EMS monitoring" gives them the data they need, and 99 percent of the group can drop back into 'doing something else' mode. Someone looking for a chat knows that at least one person is indeed listening and might answer a call.

A person calling an extended CQ on FM does seem to grate, and I think I have some handle on why. Have you ever tuned across the band and run into someone calling CQ. You stop and get ready to answer, but he keeps on calling, and calling, and calling.... Pretty soon you are feeling a little frustrated. Isn't this guy ever going to *listen* ? Maybe you even pass on, looking for someone easier to work with. You are frustrated because you very quickly got all the information available, and you are ready to go on to the next phase. On a repeater, as soon as the machine comes up you know someone is calling, and as soon as they say their call, you have the rest of the information. Anything beyond that, unless they are looking for something specific like road directions, is idle-unhappy time. And you know they should know better (unless they are new hams, in which case you greet them politely with a big smile - and lead by example).

Because of the channelised operation the mindset is different on FM also. Because many people share the same repeater resource, it's not unusual for friendships to grow among the users. As that happens you start to look out

for each other to continue previous discussions or plan an antenna party or whatever. The repeater becomes the 'watering hole', a place where different groups tend to meet and find each other. Pretty soon when I want to talk to Keith about something I take to monitoring the repeater while I read or work on some project. When Keith finds himself in range of the repeater he gives a simple call "KB2BUB monitoring" and I can pounce on him! If I am not there to pounce, everyone else monitoring for *their* friends don't have to listen to more than a momentary interruption, and that call contains what they need to know - KB2BUB is on the machine and reachable.

I think a repeater also fosters a sense of community - there's the .97 gang, all the denizens who make that repeater their home. And maybe the .61 gang, etc. The various users in the area sort themselves out until everyone has found a comfortable 'home' machine. But with that feeling of community comes the sense of in groups and out groups. There's US - those people who hang out on this machine and who know and feel comfortable with each other, enough maybe to show a little of what's behind our 'public face', our armor. And there's THEM - newcomers, people we don't recognise, etc. Perhaps when they show up on the machine they make us feel vulnerable again, time to put back on the armor until we have vetted this stranger. I wonder if perhaps that might explain why sometimes people don't feel too welcome on a repeater when they are new in town or just passing through. Their presence has disrupted the comfort level at the watering hole, as if a stranger had suddenly materialized in your living room.

And sometimes I don't feel up to talking with a stranger. On HF that means I don't bother picking up the mike and calling. But on FM while I don't feel up to dealing with a new person, I might be drawn into a conversation with a friend, or I know that someone may be trying to reach me. Announcing that "WB2EMS is monitoring" tells any of my friends that I am reachable, but doesn't commit me to answering any call - which calling a CQ sort of binds you to. (you can't weasel away saying the propagation is bad :-)

To some extent the increasing popularity of scanning radios may be starting to change some of these conventions on FM. Where before we used to pretty much monitor a single frequency for the local repeater, now we may find ourselves scanning amoung two or 3. Or the HT may be 'sleeping' for a couple of seconds at a time in power save mode. I notice that when they are calling someone people are making longer calls these days - dramatic pauses or whatever, to give the othe person's radio a chance 'wake up' or lock on the frequency. "...KB2BUB........KB2BUB.......WB2EMS is calling." Maybe scanning radios will bring back the need for a CQ on FM operations.

I have to agree with the fellow who said it's frustrating to drive long distances and encounter many repeaters, but never find anyone willing to talk. I have found the same thing - I usually make more HF contacts than I do on 2 meters when on trips. Around here when I hear a new call, especially if he announces himself more than once, I make a point of at

least making a short contact. But I have to confess that hooking up with a mobile station only to have him drive out of range in 3 minutes is kind of frustrating. Oh well.

Well, there's my two cents. Hmmm, maybe I'll save this for a handout at our next novice/tech class. :-)

Re vibrators and dynamotors.

When I first got into VHF FM stuff back in the early 70's the only rig I could afford was an old Motorola 80D - which had been pre-owned by about every other ham in Rochester before I got it. This hefty critter had both a vibrator (synchronous as I recall) for the receiver, and a dynamotor for the transmitter supply. I don't think it was in the best of tune, as I recall the dynamotor claimed to take 35 amps in on transmit. I borrowed a Bird meter one time and measured about 6 watts into the antenna. But the power was sure going *in* to the thing. I had it mounted in a '66 Chevy impala (automatic with 2 speeds - go and go faster...) and while cruising down route 81 at a steady 65 with a light foot on the pedal I could key it and watch the speed drop about 4 mph. Unkey and the speed would creep back up. I had two crystal pairs for it and changing from .88 to .94 involved pulling over and opening the trunk to swap rocks!

Vibrators, being sort of sealed, were pretty tame, but that dynomotor had a nice arc show going on which could be seen through the slots. The story that came with the radio (probably urban legend) was that about 3 owners back the fellow had done the installation right and drilled 4 nice mounting holes through the floor of the trunk to set the mounting cradle, but unknowningly he also drilled one a little too deep - into the top of his gas tank. One day after topping off his tank and forcing the vapors up into the trunk, he keyed up the rig as he got ready to go back into traffic. There was a loud "WHUMP!" from behind, and then a loud clatter as the trunk lid came back down.

Sorta makes you appreciate something like a 2SAT don't it. :-)

1871. SuperMorse on an Amstrad PC

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-14 11:07:59 UTC
From: hugh_davies.wgc1@rx.xerox.COM
Message-ID: <"14-Aug-91.12:07:59.+1".*.hugh_davies.wgc1@rx.Xerox.com>

Has anyone tried to run SuperMorse on an Amstrad PC1512 or 1640? I've been trying it on my PC1512, and the sound quality from the built-in speaker is very poor. The elements of the Morse characters are heavily distorted and clipped, so as to make it unreadable. Other than building the outboard interface, can anyone suggest what it might be? The TurboPascal Morse program I also have works fine.

Regards,

Hugh, G0CNR.

(Yes, I know I have a UK Class A license, and therefore passed a 12wpm test, but I've never used it on the air, and I thought I might start, and therefore I need to practise!)

1872. Vibrators

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-14 13:25:23 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <14.Aug.91.14
Source record: 294443

More on vibrators: I was looking at some manuals last night; one i came across was a design for a public-address amplifier that ran off a truck battery; this thing used four 807s in parallel-push-pull, and was rated at 250 watts audio output. Two Mallory synchronous vibrators were used, power drain being quoted as 22 amps at 24 volts. It was designed for air-raid warnings.
There was a matching 200-watt AM broadcast TX (two 813's) but this used a dynamotor for its B+ supply. Apparently these transmitters could always be recognised by the smooth hum the dynamotor gave to the unmodulated carrier.
I have at home one of the first mobile VHF radios (Pye Vanguard) that used a solid-state power-pack. Built in 1964, it uses a pair of 2N2152 transistors to give 500 volts at 175mA, and a nice big VHF dual-tetrode (QQV06-40A, a sort of uprated 829B) as the output tube; 60 watts FM at 170MHz output; easily converted to 145MHz and great for working mobile if you have plenty of space in your trunk for the radio.
These things were the standard Police radio in Britain for about 15 years; it used to be claimed that the only way to destroy the radio was in a car-crusher; i have seen one still working with about an inch of water sloshing around inside the case...
The radio takes 16A at 12V for full output. I am surprised at the comments from several people that vibrator-type powerpacks were in common use till the mid-70's. Maybe you Statesiders have bigger alternators and less worry about efficiency.... We went solidstate for these things in the mid 'sixties.

I am looking for anyone wishing to help with a joint
US/USSR project setting up digitial stations across the
USSR and Balkan states. KK4WW, W6YMR and I, N0ISL just returned
from a month in the USSR. We were able, through the help of
Aeroflot and the Radio Sports Foundation to bring 400 kilos
of PC's and ham gear in to set-up the net. We will be returning
next May with another shipment. This has resulted in 7 digitial
stations, a repeater in Lvov and an AP-LINK station on the air
from the USSR.

See the coming issue of QST, CQ, RTTY mag, Austrailian DX mag
and the EUDXF newletters for details. We also will be on the
program next year at Dayton.

FAIRS is a new foundation (FOUNDATION for INTERNATIONAL AMATEUR
RADIO SERVICE). For details contact KK4WW david or myself N0ISL.

73 cu es DX.

My first 2 meter radio, a Motorola 5V, used a vibrator supply. It's contemporary high power model, the 40D, used a dynamotor. I have seen a few relatively high power vibrators, but contact burning becomes a problem. By the way, the 5V vibrator was a synchronous vibrator that had contacts on the primary and secondary sides of the transformer. In effect it was self rectifying. The 1957 DeSoto radio I use on my workbench for background music uses a straight vibrator with a 5U4 rectifier. The vibrator gave up years ago and I replaced it with a 6 volt filament transformer. Now I have a nice AC powered radio.

This reminds me of my first rig. It had a pair of 210As as a push pull power oscillator and used chemical rectifiers. The rectifiers consisted of mason jars full of lye solution with copper and aluminum electrodes. They would really boil during keydown. I first had attempted to let the 210s self rectify, but got a little pink notice about a "rough" note to my signal. :-)

The 250 Hz filter does ring a bit, but not disturbing for manual CW. The
500 Hz filter is better for RTTY and packet though because it seems to have
a flatter response and better group delay. Since I'm more of a machine
digital person, I traded the 250 Hz filter back in for a 500 Hz filter.
By cranking on the PBT, it's still fine for manual CW.

>The question them becomes: "what can a ham of modest means do to ensure
>he's putting out a good signal ?"

How modest is modest? For about $200 you can get "The Poor Man's Spectrum Analyzer", the kit based around a cable tuner and other parts, which requires an oscilloscope for display. There was a recent article in Radio Electronics about a PC based spectrum analyzer, for those with a PC but no oscilloscope. I've been thinking of redesigning that circuit to be usable with other computers via a serial link; another possibility that occurs to me is to just use a meter (or maybe a peak-reading LED bargraph), a pot, and a simple frequency counter to do a hand-swept frequency counter. Considering that the most expensive part of these spectrum analyzers seems to be the output device, perhaps the hands-on approach could yield an inexpensive solution.

>I then considered that many of us have general coverage receivers.

Perhaps, though many don't, and a good GC receiver for those without might cost as much as a cheap spectrum analyzer (of course, a spectrum analyzer isn't too much use for listening to the BBC). My GC receiver, for example, poops out at 16Mc and doesn't have an S-meter at all (it's a WW-II BC-348).

>Perhaps it is possible to connect the
>transmitter to a dummy load, pick up RF via capacitive coupling, run it
>through a step attenuator and into the GC receiver.

I'd think the probable weaknesses are (1) the frequency dependance of the capacitive coupling, (2) frequency dependance of the receiver's meter response, and (3) personally, I've never seen a receiver S meter that I'd trust, but I am sure that some receivers probably have accurately calibrated meters.

It would probably give a good qualitative feel, but I think I'd want to try to calibrate it using a good signal generator before trusting it numerically.

Three of us bought W2-As at the same time. We are frequently on both simplex and repeaters. None of us have had any problems reported with audio.

1885. Looking For Mod for Bearcat 100 XLT**** Anyone know any?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-14 17:00:46 UTC
From: mdgoodma@CRDEC8.APGEA.ARMY.MIL
Message-ID: <9108141300.aa24798@crdec8.apgea.army.mil>
Source record: 294458

As the subject suggests I'm looking for people who may have modified
one of these in the past, whatever the mod. I am hoping that there are
some hidden features...

I have searched the normal places for a mod with no luck.
The chip inside is the same number as the BC205 - uniden UC-1147.
Could it be that the BC205 cellular MOD is applicable? Problem
with that is I couldn't find the 10K resister identified in the
BC205 mod.

Anyone know of any?

Please e-mail to mdgoodma@crdec8.apgea.army.mil
I will summarize anything I get.

Thanks,

Mack

From: bruno@hpldsla.sid.hp.com
Message-ID: <22360017@hpldsla.sid.hp.com>
Source record: 294399

The selection of filters is an individual preferance for serious
CW op.
THE best filter is your mind and you can pick up S1 sig. out of
the pile up if you need to.
However,if you like point to point communication with your next
door buddy, you may consider 250cy. or 150cy filter. this will
give you comfort and reliability of pleasurable QSO.
On the other hand if you are a DX maniac (like myself) you need
not only to find the DX station, but to be in sync. with the pile
up you need a window to hear what is going on and that for you may
need 500 Hz.
In contest operation as strange as may sound I operate all the time
without any filters, reason being that in the fury of pile ups same
ZA or YA station may call you off the freq. that you can miss.

As to the ringing, this nomenclature is obsolite due to superb
Quality of to day technology in general and ICOM in perticular.

>
> Perry / AA0ET

Old Technicians must show their originally issued Tech license. If it
was issued before February 15 (the day of the no-code changeover) that
would be sufficient proof that you passed 1A (5WPM code). If your original
license predates the changeover to the 3A/3B split, then you need only
take the 13 WPM code test, otherwise you need to take 3B as well.
We essentially have 3 different kinds of Technicians that need to be
tracked by the VE sytem:

1. Old old Techs (who passed 1A, 2, and 3)

2. Old Techs (who passed 1A, 2, and 3A)

3. New Techs (who passed 2 and 3A)

Confused? Don't worry, so are most people! Ed Hare from the ARRL posted
a very definitive exam-takers guide to this newsgroup, which should now
be archived on ftp.cs.buffalo.edu. I encourage its reading.

>same treatment applies to current, but current is rarely the limiter.

Sorry, Perry, but that's wrong. VSWR *is* "Voltage Standing Wave Ratio,"
but this refers to the ratio between the maximum and minimum voltages found
in the "standing wave" which occurs with a mismatch - it is NOT the ratio
of some voltage to that which would be present in the matched case. For
example, with a 75 ohm termination on a 50 ohm line/source, the reflection
coefficient at the load end is 0.2, and the expected VSWR is 1.5. If we are
driving the line with a 10V source, then a reflection of 2V occurs at the
load, making for a peak of 12V here. One-quarter wavelength back up the
line, a minimum of 8V (10V - 2V) occurs, and so we see a VSWR of 1.5 (12/8).
Note that the peak at the load in this case is 20% higher than in the matched
case, NOT 50%. (A simpler way to show this is to consider the VSWR in the
situation of an ideal lossless line with an open at the load; here
the VSWR is infinite, but the peak voltage at the load end is only 2X that of
the "matched" situation.)

Current SWR behaves in the same manner, but the minima and maxima occur at
different points - current maxima occur where there are voltage minima, and
vice-versa. The current reflection coefficient has the same magnitude as that
for voltage, but the opposite sign.

Also, I'm pretty sure you meant "E^2/R" rather than "E*E*R" in the above.

A 250 Hz filter shouldn't cause significant "ringing" unless you are receiving
REALLY fast code. The only problem with narrow filters is that you have to
tune the dial very slowly so as not to miss any signals. I like to have both
-- a 500 Hz filter for tuning around and a 250 Hz filter to drag the weak
ones out of the noise and interference.

>Has anyone ever tried this ? Is an S-meter accurate enough to measure
>the 40 dB harmonic attenuation required of most transmitters ? Is the
>typical 800 Hz CW filter too wide to measure a harmonic spike ?

No, the S-meter is probably not accurate enough unless all you want is
a rough indication. Better would be to add a step attenuator in front
of the receiver. Set the attenuator for some convenient level on the
S-meter, tune to the spurious frequency, and re-adjust the attenuator
for the same meter reading. The difference is the spur level.

Capacitive coupling to the dummy load would be OK for checking close-in
spurs, but nor for harmonics. (The coupling factor increases with
higher frequency.) What you want is a broad-band, high-power attenuator.
You can build one out of a Heathkit dummy load and a few 2 watt resistors.

To measure transmitter intermodulation distortion (splatter), you would
need a receiver with a very narrow CW filter with good skirt selectivity.
Feed a 2-tone signal into the mic (say, 1 and 2 kHz) and look for the
third-order products a kHz above and below the desired 2 output frequencies.

>immediately after the RF amp. I want to mod one of these filters to enable
>receive down to at least 70Mhz. I hope you can help as I cannot get a service
>manual here in New Zealand yet.

Looking at the S.M. schematic the first thing I notice is the inclusion of
the VCO circuit that is not in the Owners Manual schematic.(The blank area in
both V and U RF Units). The main schm. (with the two logic controllers) is
missing a tone unit (called IC3 TC4W53F). The service man. says "IC-W2A/E" on
the cover, so I think there is only one... I called ICOM and gave them a Visa
number, which is what I suggest to you. USA 206-454-7619. $20 plus an arm or
leg to get to N.Z. However that doesn't answer your question.
L's 1,2 and 3 are the inductive components that tune the VRFA unit...
They are coupled with D's 2,4 and 5. I think that what would have to be
changed, somehow. Things are tiny inside, but not as small as some people
have described.(I'm grateful I'm near-sighted).
My solution (considering I spent $550) is to make an external up-convertor.
We have them here in the States for the previous generation H.Ts. to listen
to the Public Service freqs. I don't know why you'd like to listen to 70 MCs
(only thing I can think of for here would be Radio Control channels for
activity or interferance) but I wouldn't change anything in my unit since
I'm happy with it's WB receiving capability as it is. Since it can't demod.
WBFM there's nothing below 120 MC of my interest. I'd rather have marine
band,seeing how I spend leisure time between here (Boston) and Bermuda.
However, this is what the manual says:
In section 3-1-2 of the manual I quote:
The RF curcuit amplifies the received signals up to the level
needed at the 1st mixer circuit. The 1st mixer curcuit converts
the received signals to a fixed frequency of the 1st IF signal
with a PLL output frequency. By changing the PLL frequency,
only the desired frequency can pass throught a pair of crystal
filters at the next stage of the 1st mixer.

The VHF RF signals from the antenna switching circuit are
amplified at Q1 and Q2 and are then converted to a 1st IF
signal at Q6. The frequency of the 1st IF signal is 30.85 MHz.
Q6 converts the RF signal using the V PLL output signal from
D16.

The VHF RF circuit adopts a tuned bandpass filter circuit that
tunes the filters to the center frequency of the receiving signal
using varactor diodes (D2, D4, D5). A PLL lock voltage is
used for the filter tuned signal. copywrite 1991 by ICOM,inc.
de Skip, NT1G F=617-577-4019
P.S. I had my audio checked OTA and there were no complaints except for
low audio (2-3" away from mike). I decided to do another test, this time
with my scanner and a 'boom box' recording through the air. My IC-W2A sounded
the same as my IC-2AT and better than my Kenwood TH-21A. On thing I did note
was the phrase "My nose is on the keypad". That did sound much clearer,better
louder. Maybe an external mike would help.

And now for something completely different....

ARMAMENTS 2:9-21 And St. Attilla raised the hand-grenade up on high,
saying "Oh Lord, Bless this thy hand-grenade, that with
it thou mayst blow thyne enemies to tiny bits, in thy
mercy." And the Lord did grin. And the people did feast
apon the lambs...And the Lord spake saying "First shall
thou take out the holy pin. Then shall thou count to
three. No more, no less. Three shall be the number
thoust count, and the number of the counting shall be
three. Four shall thou not count, noy thou count two,
accepting that thou then proceed to three. Five is
right out. Once the number three, being the third
number be reached, then lobst thou thy Holy Hand-
Grenade of Antioch, toward thy foe, who being
naughty in my sight, shall be snuffed."
Amen.

It's probably bad power supply filter capacitors. Electrolytics dry
out after a time.

It could also be a cathode-filament short in one of the tubes.
I'd bet on the electrolytics, though.

>I'd think the probable weaknesses are (1) the frequency dependance of the
>capacitive coupling, [...]

Actually, there's a better way, instead of using a capacitor, use a 1530 ohm non-inductive resistor. I used a chip resistor and some semi- rigid cable to make one up the other day and ended up with a "30-dB power attenuator" that seems to be good to over a gigahertz. Basically, you just make a voltage divider with the 50-ohm input of your receiver (or whatever) with the correct power ratio to give you however many dB you want to attenuate. It's a little messy to calculate, but the VSWR is _very_ good if your attenuation is high.

BTW: The "Poor Man's Spectrum Analyzer" made from CATV tuner and such is a neat little project, but you really need to use it with a storage scope, a normal scope doesn't have enough persistance at the slow sweep speeds you need to use. Someday I'm going to build a computer interface for mine, and do the storage digitally.

Gary, this sounds like a good idea all around. Can you give pinouts for the standard connections? Since there are 5 pins, are different pins used for different voltages so that equipment requiring different voltages can be connected to a common power source? Also, are the female connectors are used for the supply side?

1901. Re: A Poor Man's Spectrum Analyzer

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-14 21:03:58 UTC
From: mjj@stda.jhuapl.edu
Message-ID: <1991Aug14.210358.3637@aplcen.apl.jhu.edu>
Source record: 294467

Problem:
>>A recent post about tweaking a Kenwood 830S for more output power was
>>followed by my suggestion to look at the result on a spectrum analyzer.
>>It then occurred to me that not everyone works for HP or otherwise has
>>spectrum analyzers available to them.

Solutions proposed:

1. Use the WA2PZO "Poor Man's Spectrum Analyzer"
2. Use the PC-based spectrum analyzer described in R-E
3. Make a general coverage ham transceiver scan the spectrum under
computer control and measure the S-meter reading.

OK, well the first two are adequate for _indications_ of spectral power
at frequencies other than the carrier. However, #1's solution has
unacceptably coarse frequency indications. So maybe use #2.

But what if you want to look at phase noise? #1 and #2 fail here
because their narrowest resolution bandwidth is 15 kHz, which is
OK for VHF FM alignment but stinko for HF work. In any event both
#1 and #2 have noisy LOs; feh.

Well, #3 might work for phase noise measurements if you have a 400 Hz
(or narrower) CW filter. I have found Kenwoods to have very good
S-meter accuracy over the entire range (+/- 2 dB!); I believe Icoms
and Yaesus are poorer in this regard.

/* Steps up to the podium */

Hmmm...speaking for myself, I find none of these terribly attractive.
I'd like to think that with the increasing availability of good
quality mixer, filter, and MIC modules, we hams ought to be able to do
better than the present under-$500 spectrum analyzers.

Furthermore, ham experimenters can no longer afford to be as sloopy
as they were 20 years ago, when we would slap together a 40-meter class C
xmtr, tune for max output and to hell with any spurs. That doesn't
wash anymore within a worldwide shared-spectrum community. In the
US's increasingly complex infrastructure, a rogue emission could
kill somebody in an ambulance or trash a mariner's WEFAX image.

/* Takes seat */

I'm entering the rumination phase of a spectrum analyzer design which
is better to suited to hams, in terms of both price and performance.
E.g., clean LOs and narrow IFs for the .5 - 30 MHz range, wider
dispersion for VHF up to 500 MHz, and decent frequency and amplitude

outputs. If anybody has ideas to contribute, I'd like to hear 'em.

Cheers,
Marshall Jose WA3VPZ

1902. Looking for a Mobile VHF

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-14 21:19:32 UTC
From: sped@cc.usu.edu
Message-ID: <1991Aug14.151932.48774@cc.usu.edu>
Source record: 294470

I'm in the market for a good mobile 2-meter radio
I was looking at the Kenwood TM-241A but after reading Gary's
posting I'm not so sure.
Can any of the more experienced people out their point me in the right
direction?
Any information would be appreciated.

I dont have a chance to read the news very often so could you please
send any replys to : BAJONES@cc.weber.edu

thanks
Bruce, N7TKX

I've never been asked for my license when buying ham stuff. What do you
think you would really accomplish by refusing to sell one? The person
could just go out and buy from someone else. Also, they can be used
to listen, and may be an incentive to someone to get a license.

>direction?

I've got the TM-241 and it's been a solid performer for me. Nice
little radio. I've also got the TM-721, which in my opinion is one of
the most reliable modern day mobile rigs ever built. I also owned the
TM-3530 which I liked a lot and was also trouble-free. I've never had
to deal with Kenwood Service, but that fact alone says something!

Trancievers that I've owned: Comments:

TS-820S (HF) Good receiver, nice sig reports
TM-3530 (220 Mhz) Good clean fun - nice autodialer
TH-41BT (440 HT) Cheap junk, but it worked...
TM-721 (2M/440 Mobile) Get the display upgrade - it's great!
IC-2GAT (2M HT) Good solid performance - bad user interface
TS-440SAT (HF) Decent Radio, never had a problem
IC-32AT (2M/440 HT) Survived several drops on concrete - worked well
Swan 500CX (HF) Get a Rope!
YAESU MEMORIZER (2m Mob) Can't complain for $50....
Kenwood TH-215 (2m HT) Strange user I/F - good audio - weak batteries
Azden PCS 5000 (2m Mobile) Awful user interface, lighted buttons OK
Kenwood TS-830S Excellent Receiver - sold it too cheap at $525
Kenwood TS-850SAT Big Bang for the Buck! Wish I had time to use it
Icom W2-A (2m/440 HT) Not as sturdy as the 32AT, but LOTS more features
Tempo FMh (2m HT) Well worth the $12 I paid for it :-)

Hmmm, that makes 15 radios in less than 3 years... I need help.

1906. Solar Bulletin - Automated E-Mail Receipt of Hi-Res Solar Images

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-14 22:55:03 UTC
From: oler@hg.uleth.CA
Message-ID: <0094D1E0.1D001040.17144@hg.uleth.ca>
Source record: 294474

/\

SOLAR TERRESTRIAL BULLETIN

14 August, 1991

Automated E-Mail Solar Image Service
For Persons on the Larger Networks

/\

AUTOMATED RECEIPT OF SOLAR IMAGES ON THE ELECTRONIC NETWORKS (INTERNET, ETC):

Solar Terrestrial Dispatch is now providing a service to send
high-resolution solar images (most of which are full-color high-res images)
to interested persons on the Internet, BITNET, and other reachable networks.

For information on obtaining these images through the electronic
networks via this service, send a request for additional information to:
Oler@Hg.Uleth.CA, or to: COler@Solar.Stanford.Edu. A small informational
document (under 10K) will be returned to you explaining the service and what
must be done to begin receiving the images. This small document may also be
downloaded from the STD BBS (at (403) 756-3008) if you want to obtain the
information yourself.

This service is being provided to help satisfy the large interest which
exists for these images. The images are provided in GIF format and should
therefore be compatible with almost all types of computer systems that are
adequately equipped with GIF image viewing programs. GIF image viewing
programs are widely available on local BBS's or through anonymous FTP (ex.
from wuarchive.wustl.edu, wsmr-simtel20.army.mil, nic.funet.fi, etc).

Source record: 294475

Hi Gang,

This discussion about an inexpensive spectrum analyzer perked my ears!

Many years previous, I used the general coverage receiver and S-meter trick to observe harmonic energy. In my application, I used a Microvolter to calibrate the S-meter reading at the received signal indication. The reason the calibration step was required is that S-meters are not linear with respect to the received signal strength. In the absence of any other analyzer, the S-meter technique works OK.

Prior to WWII a Panadapter was developed by Panoramic which attached to the output of the first mixer of a general coverage receiver. The result was a narrow band spectrum analyzer. The bandwidth was determined by the passband of the host receiver's front end. Several such adapters were made for the military by Panoramic and others. After the war, Heathkit sold an adapter kit which mimiced the Panadapter. Occassionaly, the Heathkit version shows up at swap meets at reasonable prices. This is about the cheapest spectrum analyzer available, but it requires an external calibration source when reasonably accurate measurements are needed.

Should the local oscillator be swept over a frequency range, then a general coverage receiver would approach the function of a spectrum analyzer. Using an oscilloscope to monitor the amplitude of the detector's rectified output, and synchronizing the horizontal sweep to the swept oscillator, then a spectrum analyzer display would occur. The result is much better than using the S-meter as an indicator, and probably better than using the Panadapter method.

Several very good articles have been written on building a spectrum analyzer. Here is a reference listing:
QST, Nov 1985, pg 23
Ham Radio, Sept 1986, pg 82
Ham Radio, Jan 1988, pg 25
Ham Radio, Nov 1989, pg 9
Radio Electronics, July/Aug 1991

In addition, Science Workshop, Box 393, Bethpage, NY, 11714, has developed a parts kit to build an analyzer which utilizes an oscilloscope for a display.

I built two versions of the latter and am very satisfied with the results. My only minor objection is that my analyzers do not have variable dispersion which would allow me to better analyze transmitter modulation characteristics. Other than that, my analyzers operate over a frequency range of 1mhz to 1000mhz, and with additional converters, they go to 2500mhz. The cost? I spent about $100 each plus the oscilloscope. Fortunately, most any inexpensive scope works in this application.

Regarding the analyzer written up in Radio Electronics, I too, would like to see the circuit modified to interface through an RS-232 port for use with any computer configuration. If John Woods, WB7EEL has the inclination to do a modification I would be willing to attempt building one.

This is a neat topic, keep it up!

1908. Re: On-Glass Antennas

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-14 23:35:03 UTC
From: casc@hpindda.cup.hp.com
Message-ID: <100010006@hpindda.cup.hp.com>
Source record: 294397

Regarding the use of on glass antenna:

I've an Antenna Specialist Glass Mount on my pickup for 220. Some folks swear by them.... others swear at them. In my case it's working fine and I hate punching holes in my vehicle.

The directions included a little template to lay over your window to show:
1) space needed between the antenna and the car's sheet metal
2) areas where defroster wires should not be (so I assume this is a major no no)

After mounting, I did adjust the antenna. Major difference in SWR readings. The directions also recommend it.

ALso the beastie is on my windshield, and a couple of friends have them on the wing windows of their cars. The adhesive is quite strong.

So on a purely anecdotal note... the glass mount works for me.

The above reflects only my experience and my employer knows nothing.... about my antenna! 8}

1909. Alarming Scanner Legislation (Relayed Article)

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-14 23:52:00 UTC
From: 0003829147@mcimail.com
Message-ID: <35910814235253.0003829147NB4EM@mcimail.com>
Source record: 294476

[Note: At the same time I'm posting this article to the net, I'm sending a courtesy copy to the ARRL, where I'm an associate member. -SJR]

I wish to relay to the net an item posted in the rec.radio.shortwave conference. I feel this announcement is important enough and has enough significance even within the ham-radio community that I am posting the articles in their entirety.

*** BEGIN ARTICLE #1 ***
From: antenna@well.sf.ca.us (Robert Horvitz)
Newsgroups: rec.radio.shortwave
Subject: Scanner Ban Sought by Cellular Industry
Date: 9 Aug 91 03:54:34 GMT
Organization: Internews

The cellular industry is once again trying to ban scanners capable of receiving any frequency allocated to their service. As usual, they waited until Congress' summer recess drained Washington of observers.

If their strategy works - and unless scanner owners act quickly, it looks like it will - the tuning capabilities of radio receivers will shrink as other services try the same legislative tactic.

On 30 July 1991, Rep. Matthew J. Rinaldo (R-NJ) introduced H.R. 1674, the FCC's budget authorization for 1992. This bill includes the following passage:

"...SEC. 8...(d)(1) INTERCEPTION OF CELLULAR TELECOMMUNICATIONS --Within 180 days after the date of enactment of the Federal Communications Commission Authorization Act of 1991, the Commission shall prescribe and make effective regulations denying equipment authorization...for any scanning receiver that is capable of--

(A) receiving transmissions in the frequencies allocated to the domestic cellular radio telecommunications service,

(B) readily being altered by the user to receive transmissions in such frequencies, or

(C) being equipped with decoders that convert digital cellular transmissions to analog voice audio.

"(2) MANUFACTURE OF NONCOMPLYING EQUIPMENT.--Beginning one year after the effective date of the regulations adopted..., no receiver having the capabilities described in subparagraph (A), (B), or (C) of paragraph (1) shall be manufactured that does not comply with the

requirements set forth in paragraph (1)."

H.R. 1674 was quickly adopted (passed) by the Subcommittee on Telecommunications and Finance, and is now before the House Energy and Commerce Committee. The Committee can be reached by writing/calling/faxing:

John D. Dingell, Chairman
Committee on Energy and Commerce
2125 Rayburn House Office Building
Washington, DC 20515-6115
Phone: 202-225-2927
Fax: 202-225-2525

The Committee's Legislative Assistant is Lisa Kountoups. Since Rep. Rinaldo is Republican, it might be better to contact the Minority staff's Legislative Assistant, Darlene McMullen.

Here is a list of Representatives serving on the Committee. If your Congressman is among them, call the US Capitol's Locator Service (202-224-3121, open 24 hrs/day) to get their address and phone number. CALL/WRITE/FAX THEM IMMEDIATELY TO EXPRESS YOUR OPPOSITION to the scanner ban contained in SECTION 8 of H.R. 1674 (FCC authorization bill for 1992). Since Congress is now in recess, contact their Home District Office. The Locator Service can give you that address & phone number, too:

Joe Barton (R-TX), Michael Bilirakis (R-FL), Thomas Bliley (R-VA), Rick Boucher (D-VA), Terry Bruce (D-IL), John Bryant (D-TX), Sonny Callahan (R-AL), Cardiss Collins (D-IL), Jim Cooper (D-TN), Willian Dannemeyer (R-CA), John Dingell (D-MI), Dennis Eckart (D-OH), Jack Fields (R-TX), Ralph Hall (D-TX), Claude Harris (D-AL), Dennis Hastert (R-IL), Clyde Holloway (R-LA), Peter Kostmayer (D-PA), Richard Lehman (D-CA), Norman Lent (R-NY), Thomas Manton (D-NY), Edward Markey (D-MA), Alex McMillan (R-NC), Tom McMillen (D-MD), Carlos Moorhead (R-CA), Michael Oxley (R-OH), Bill Richardson (D-NM), Matthew Rinaldo (R-NJ), Don Ritter (R-PA), J. Roy Rowland (D-GA), Dan Schaefer (R-CO), James Scheuer (D-NY), Philip Sharp (D-IN), Gerry Sikorski (D-MN), Jim Slattery (D-KS), Gerry Studds (D-MA), Al Swift (D-WA), Mike Synar (D-OK), Billy Tauzin (D-LA), Edolphus Towns (D-NY), Fred Upton (R-MI), Henry Waxman (D-CA), Ron Wyden (D-OR).

*** BEGIN ARTICLE #2 ***
From: antenna@well.sf.ca.us (Robert Horvitz)
Subject: House Commerce Committee passes Cellular Scanner Ban

Date: 12 Aug 91 05:23:33 GMT

Benn Kobb (KC5CW) just notified me that the FCC's 1991 authorization bill, which contains a passage that would ban all scanners capable of tuning cellular radio frequencies, or being modified to do so, was passed by the House Commerce Committee just before they adjourned for the August recess.

The bill will be taken up by the full House when Congress returns from vacation.

So the ban has moved a giant step closer to implementation. In the next step, all Representatives will have a vote. So it no longer matters whether your Representative serves on the Commerce Committee. EVERYONE should contact their Representative and urge them not to accept Section 8 of HR 1674.

The Senate will have to concur in this, so you might also contact your Senator to stop similar language from being added to the Senate version of the bill.

This isn't just about cellular and privacy protection. It's about the public airwaves being made inaccessible to the public.

--

Cross-posted to: sci.electronics,rec.radio.amateur.misc

Now that the net.peter.police have finished their ranting, here's an answer to the original question. A "laser bounce" listener device kit can be bought from Information Unlimited, Dept RES11, Box 716, Amherst, NH, 03031 (603) 673 4730 (603) 672 5406 (fax) 800 221 1705 (orders only) The kit is part number LLIST20 and costs $299. It comes with the laser, a receiver, an amplifier and a set of headphones. Information Unlimited always has interesting goodies and the catalog is available for a buck.

Disclaimer: Whether I have a relationship with Information Unlimited is none of your damn business.

John

Wed Aug 14 23:42:24 1991

The new Radio Shack 1992 catalog is out and there are some new faces:

PRO-37: The PRO-34 is gone but the PRO-37 is here. Hyperscan comes to Radio Shack handheld units. The PRO-37 seems to me identical to the PRO-34 with the exception of scanning speed. The PRO-37 will scan at 26 channels per second. I have't recieved the service manual for the PRO-37 yet but it's likely a mod will be possible to speed up the PRO-34 to PRO-37 speeds without sacraficing delay time. I'll talk with Bill Cheek (Scanner Modification Handbook) and see what he says. He may have a copy of the service manaul already. Anyway, the PRO-34 is on sale till the 18th for $239. This is an AWESOME deal and I highly reccomend it, The PRO-37 will sell for a mere $299 which is an excellent price. You'll have to decide if the expanded speed is worth the money. No word on when the PRO-37 will be in stores.

PRO-42: The PRO-42 is a new 10 channel scanner that has a full frequency display. This unit looks very nice if you want a very low cost scanner. The unit does not have 800MHz but otherwise is full featured. There is no search function so this unit is only for use with a frequency list or more capable scanner. The scanner only costs $139 so it's a deal compared to the competition. The PRO-41 at $119 is a joke (The PRO-41 is the physicaly redone PRO-38) compared to the PRO-42. The next step up is the PRO-36 with 20 channels and search but the PRO-34 kills it for now at $239.

DX-390: This is the new 150kHz to 30MHz shortwave reciever with a BFO for SSB. I have no idea what the point of this unit is. The DX-390 cost $239 but the DX-440 is still around at $199. The DX-440 is a strong performer made by Sangean. We'll have to wait and see how nice the radio is when it arives in stores. There are some quirks and problems with the DX-440 that may have been cleared up. More news on this later.

--> HTX-202: This is a brand new 2 meter HT that looks awesome. The catalog is pretty unclear about details but on the surface this looks like a winner. The unit has scanning, DTMF, tone squelch, sub-audible encoder, priority, long life battery with spare aklaine pack, charger, belt clip, 5 watts minimum output. Wow, not bad! This unit will sell for $259 which looks like a nice deal. We'll have to get more specific information on this unit before we can pass judgement on it but everything looks pretty nice. No idea when we'll have this unit in stores.

Wow, I'm done. PRO-2006 is now $399, the PRO-2022 is now $299. There are two new base scanners, the PRO-59 and the PRO-58. These are 10 channel units that are very similar to the PRO-41 and the PRO-42.

Source record: 294387

In a way, requiring someone to show a ham license when buying a radio is a bit like requiring people to show a valid driver's license when buying a car.

People who *want* to break the law generally find ways to do so. As long as RS makes sure that the purchaser *knows* that s/he needs an FCC license to transmit (which they seem to be doing more than adequately by the stickers on the radio itself), then it seems fair to me that the purchaser need not have to produce a ham license.

Limiting RS's responsibility to one of purchaser awareness rather than policing should be more than adequate to prevent most cases of unintentional misuse.

One could even argue that RS does not have the right to refuse the sale of a ham radio to someone failing to produce a valid license as there does not seem to be any existing legislation regarding the marketing of "restricted use" appliances.

INFORMATION REQUIRED FOR SCANNER BEARCAT UBC 200 XLT
==========

This scanner has some built-in features which are not documented
in the user manual.
These features are probably service tests, and are not published for
that reason.
Is anyone familiar with this scanner, and in the opportunity to give that
information? I am especially interested in (possible) changes in
frequency range, clearing the memory or banks (NOT by shorting the
battery!), etc.

Maybe it is possible to modify the "weather" frequencies, these are
not used in Europe.

Thanks in advance, any comment is welcome.

Boy is my face red! I went down to the shop to check the pinout and found
that the connectors are *4* pin XLR not 5 pin. Pin 4 is ground, pin 1 is
+12 volts, pin 2 is +24 volt, and pin 3 is +48 volts. The connector on
the supply side is female and the equipment side is male.

1921. Crystal Filters for 8.83 MHz IF

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-15 12:01:21 UTC
From: cchapman@msd.gatech.edu
Message-ID: <cchapman.682257681@matd>
Source record: 294390

I want to add a CW crystal filter to the IF of my Heath HW-5400. Does
any commericially available ham gear (like ICOM, Yaesu, etc.) use an
8.83 MHz IF so I could use one of their filters? If so, who sells crystal
filters at this frequency?

Thanks,
Chuck, WB4UIH

From: graham%drcv06.DEcnet@drcvax.af.mil
Message-ID: <9108151334.AA04679@ucsd.edu>
Source record: 294391

Hello,

I don't subscribe to the list because I have little time to read mail. So, this may be a very old subject. I would like to get a copy of the question pool in a format that I can use on the VAX. Either ascii or a .z file would do very nicely. I want to construct some sample tests for my wife, going after her tech and myself, going after my extra. If anyone has such a beast, or know where I may ftp it, please let me know directly to the address below.

Thanks very, very much. (The books are not useful to me because I'm blind, I have a speech synth on the computer, but it doesn't read books for me.)

I just saw Die Hard II, and realized I haven't seen anywhere near the traffic on this list for the sequel as for the original. Did I just miss it, or is everyone on the list cheap like me and waiting for it to come on cable tv to see it?

What is a Kenwood TH-45at anyway? Something 440 apparently.
Jim, NE3X

1925. ICOM IC-24AT Mods

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-15 15:17:38 UTC
From: abc@rock.concert.net
Message-ID: <1991Aug15.151738.15511@rock.concert.net>
Source record: 294393

Being mid-way through my studies to become a no-code technician, I purchased an IC-24AT. The person that had previsously owned the radio had modified it to allow it to trasmit out-of-ham-band. My question is this:

With the modifications, what are the new frequency limits?

Any ideas on this?

Thanks,
-abc

1926. Re: Radio Shack HTX-202 2-Meter HT

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-15 15:29:27 UTC
From: furuta@crayola.cs.umd.edu
Message-ID: <38139@mimsy.umd.edu>
Source record: 294394

At the risk of getting back into the "yes it is a problem/no it isn't" discussion that seems to have characterized threads involving Radio Shack and ham equipment, I'd like to question the basic assumption that seems to underlie the discussion: that the unlicensed masses will want to go out and buy a 2m HT in the first place. Even at $259, which seems to me to be an OK (but not great) price for a 2m HT, the unit costs over $100 more than Radio Shack's highest priced CB walkie talkie. Compared to mobile units, it costs over $200 more than the lowest priced mobile CB unit. This doesn't sound like the kind of a unit that Joe Consumer, wanting to buy a radio to talk to his friends, is going to find that attractive; especially since he has to convince his friends to shell out money for their units as well. Admittedly, there are always a few people with more money than brains, and people who for some reason or other feel compelled to be pirates, but I suspect that those people will be perfectly capable of finding 2m transmitters at hamfests, via mail, or whatever. I've heard a few unlicensed people on the repeaters around here, but I've also heard the repeater occupants quite effectively and efficiently run them off.

The Radio Shack catalog's presentation of the 2m HT is quite responsible---it emphasizes that a license is required and gives a nice sales pitch for getting the NoCode Technician license.

Source record: 294396

I have had an ft470 since I first became a ham a
year and a half ago. I have found it easy to repair
and the folks at Yaesu are very helpful.

My rig has been dropped in a lake 2 times, fallen through the ice in winter
once, left out in an ice storm once, and burried by the dog once. It still
works.

I was impressed.
A week ago I was putting up an antenna on a 100ft tower and I dropped
my beloved ht. It hit a yard arm 10 ft off the ground so hard that the
genuine simulated leather case is no longer. My ground walked over to my
rig, tuned to a local repeater, keyed the rig..... didahdah didah dididahdahdah
dahdahdidit dahdididah dahdididahdit didahdit .... wow! it still works
he said!

Still no problems.
What more needs to be said...I used to be in the market for a new HT but
I think I'll keep this one for a while!

From: perry@hpfcdc.HP.COM
Message-ID: <39910120@hpfcdc.HP.COM>
Source record: 294279

>>The question them becomes: "what can a ham of modest means do to ensure
>>he's putting out a good signal ?"
>
>How modest is modest? For about $200 you can get "The Poor Man's Spectrum
>Analyzer", the kit based around a cable tuner and other parts, which requires
>an oscilloscope for display.

Alas, a scope is expensive. I was considering connecting the common
shack appliances in a new and creative way in lieu of a real analyzer.

>>Perhaps it is possible to connect the
>>transmitter to a dummy load, pick up RF via capacitive coupling, run it
>>through a step attenuator and into the GC receiver.
>
>I'd think the probable weaknesses are (1) the frequency dependance of the
>capacitive coupling, (2) frequency dependance of the receiver's meter response,
>and (3) personally, I've never seen a receiver S meter that I'd trust, but I
>am sure that some receivers probably have accurately calibrated meters.

Ack. Reality enters. I suppose we could use resistive coupling - like
a pi circuit using 50 ohms for the legs and 10K-100K for the top. The
whole thing would have to be calibrated/derated against a known source,
like a transmitter and Bird wattmeter. (oops, another use for GC
transmitters and out-of-band mods !)

>It would probably give a good qualitative feel, but I think I'd want to try
>to calibrate it using a good signal generator before trusting it numerically.

Right. If you know the link and meter's response curve given constant
power, you could then adjust the reading you get. Since there should be
few peaks in a good transmitter, there wouldn't be a lot of correcting
to do. :-) It would be tedious, though. Thanks for the insight.

Did ya ever notice.....

...Why some people refuse to talk over a repeater ID while others
just ignore it altogether? What's your preference?

...How some people turn the conversation over with "GO"? (Personally,
I think I need a barf bag when I hear this).

...That some people think that you are in violation if you don't ID
at the _beginning_ of a qso? (Not in the rules ya know...)

...How husband/wife qso's are among the worlds most boring to
monitor? (get a cellular PLEASE :-)

...That the weather gets talked about more often on the air than in
person?

...That 99%, no make that 100% of the time, that when you have your
first "eyeball" with someone you've known for a while looks completely
different than what you imagined? And that their appearance is usually
a disappointment?

...That the last person you'll ever hear on a repeater is the trustee?

...That many hams will switch to high power when you tell them that
their modulation is weak (despite the fact that they're already at
full quieting)? And that many will say that it's a "little" louder?

Well, maybe it's just me :-)

1932. WANTED: QRP transceiver (HF) --- buy, build, whatever

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-15 17:20:22 UTC
From: zjdg11@eddie.chi.amoco.com
Message-ID: <1991Aug15.172022.19857@hou.amoco.com>
Source record: 294420

I'm in a not-too-uncommon situation..... I live in an apartment, and want to run HF. to make matters worse, it's a studio apartment, meaning I have virtually no room for an antenna. I'm 23 floors up, so I can't take a walk outside and hide something in the trees (like I used to do).

to make matters even worse, my old HF rig is a Galaxy V Mk 3, only works on 20 meters these days, and the power can no longer be varied --- it's flat at 300 Watts (measured with a Bird into a dummy load), and the output destroys TVs, stereos, etc. if it doesn't have a nice, full-length dipole in a tree well clear of everything else.

I don't want to run that much power and even take a chance on messing with my friends' TVs, so an indoor, heavily loaded antenna is pretty much out.

I also want very badly to get back on CW.... VERY badly.

I'm very interested in getting (build/buy/whatever) a QRP transceiver or receiver/transmitter pair. I'd prefer that it be for 30 meters, but I'm interested in whatever anyone has to discuss. at least some limited VFO capability would be nice, but.....

I don't really care if it knows how to handle voice....just CW.

any information at all would be greatly appreciated. oh, btw, the budget isn't that great.....

THANKS!
--jim

Standard disclaimer....Ever since my cat learned to type, there's no telling whose thoughts these really are....but they are not my employer's (are they?).

1933. FT470 Expanded UHF

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-15 17:33:52 UTC
From: svec@motcid.UUCP
Message-ID: <7118@feldspar2.UUCP>
Source record: 294412

I live in the US of A so would always want to preserve the TX/RX
ability between 440-450Mhz. Up to now, I have always understood
the Yaesu FT470 to not allow RX beyond 450 unless you compromise
the 440-450 portion (see excerpt from an entry in MODS database):
6.1 UHF

R70, R71, R72 select the mode for the UHF portion of the
FT-470. The choices are:

```
+=================================================================+
|R71 R70 R72 Rx and TX Receive only |
+=================================================================+
|0 0 0 430 to 440 Mhz 430 to 500 Mhz |
|0 0 1 430 to 450 Mhz |
|0 1 0 430 to 440 Mhz |
|0 1 1 432 to 438 Mhz |
|1 0 0 430 to 440 Mhz |
|1 0 1 220 to 225 Mhz |
|1 1 0 430 to 440 Mhz |
|1 1 1 210 to 235 Mhz |
+=================================================================+
```

Table 6-2 UHF Modes

I recently heard someone talking on a repeater (I will do my best to
get further details) that he did a mod on his radio which...
-Left VHF intact
-Preserved TX/RX 430-450 (normal ham band) (contrary to above chart)
---AND---
-Allowed him to RX (perhaps TX but did not ask)
all the way up to 500Mhz or thereabouts.
In fact, from Lake Zurich (about 30 miles NW of Chicago), he
was able to receive TV CH-16 from South Bend, Indiana! this being
in the 480Mhz range (of course the 75kHz audio was distorted but
none the less it was there).... in any case, was still quite
sensitive up there.

The thing to note however is you do NOT enter the extended UHF freqs in
the normal way but must start at 500Mhz (I believe) and step down
using Mhz or Khz stepping until you are where you want to be.
If you pass it up, you must re-start again... no big thing.

You can then enter it into memory at that point for later quick access.
He stated it worked great with the local PD at 471Mhz.
(Radio has about 40 memories so no big thing).

Does anyone know of any such info? Up to now, I have never seen any
hint of this on the net. The person who did it is a radio engineer
for Motorola so while it is possible he did a major hack job on the radio,
I believe it was only a minimal jumper or simple component change
such as a diode or resistor kind of thing by the way he was talking
about it. As soon as I get more details, I will post it.

>standard connections?
>73/Lee, N5LYT

The problem with all of the above is that I don't want to be
able to borrow a battery from a broadcast crew. I want
to be able to borrow power from other hams or use power all
ready available at a pre-prepared sight and I want to do
this whether I'm helping out in Santa Clara or Santa Fe!
Thus the need for a national standard power connector
for emergency work. Such a connector was presented
in the July Field Forum. There are applications where
this connector isn't appropriate (like drawing 20Amps
for an HF rig(though you could double up on em..)) BUT
instead of argueing the fact that it isn't appropriate for
all applications(there just aint no such animal!) we
should start using it where appropriate and move on to
other matters.

1935. Pet Peeve (crossposts between .misc and .swap)

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-15 18:05:40 UTC
From: acm005@zeus.unomaha.edu
Message-ID: <20007.28aa6e14@zeus.unomaha.edu>
Source record: 294332

I've mentioned this before, but after seeing 4 more messages go by this week, I feel the need to state this again.

Is it really necessary to crosspost equipment for sale to both the discussion groups and the swap group? The fact that you *DID* crosspost it indicates that you knew of the existence of the swap group (many, admittedly do not, and are not the target of my wrath).

It is my understanding that netnews sends out one message with pointers to each of the crossposted groups, so bandwidth is not increased. However the purpose of compartmentalizing for-sale messages in their own group (to keep the discussion groups clear for discussion and avoid potential political/legal problems with the mailing list gateways) is essentially defeated.

There is an excellent _Introduction to the Personal Radio Newsgroups_ written by Jay Maynard, K5ZC, archived on ftp.cs.buffalo.edu under file ~pub/ham-radio/guide2newsgroups. It covers much of the historical background and current purposes of the various rec.radio.* newsgroups, including the many important reasons for having a separate swap group. I encourage its reading.

So, am I just blowing in the wind, or am I stating a concern shared by many? If not, I'll go back to my corner....:-)

1936. My List of Mail Order Electronics Companies

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-15 18:27:52 UTC
From: jfw@ksr.com
Message-ID: <5048@ksr.com>
Source record: 294403
Cross-posted to: sci.electronics,rec.radio.amateur.misc

[Revision 2.1; last updated 16 August 1991]

Here is my list of companies which will sell electronic components in small quantities. Most of these places I have bought from, a couple I haven't. Being a ham radio operator, I am most interested in RF components, and in particular, air variable capacitors, which tend to be scarce (and tend to be used or surplus even if I've otherwise labelled the seller as "NEW"). I apologize in advance for disparaging remarks about what happens when parts suppliers start selling computers, but anyone who has watched Jameco over the years will know just what I mean.

Categories are:
NEW COMPONENTS Distributors and sellers of new components, or "new and some used" in a couple of cases.
SURPLUS ELECTRONICS Usually overstocks, occasionally used equipment. Ideal for stocking the junkbox, usually have dependable stock lines of resistors, capacitors, and some semiconductors, but won't have those LCD modules forever... An invaluable resource, don't shy away from them.
SPECIALTY COMPONENTS In particular, crystals and toroidal cores.
KITS Ham radio kits, random electronic kits, whatever they have.
LITTLE GUYS Separated out because of some twisted sentimentality, I suppose. Intended to honor one or two ham spare-bedroom operations.
PUBLICATIONS Two publications which are essentially all want-ads, plus the address for SAMS PHOTOFACTS because everyone always asks about it on sci.electronics.

NEW COMPONENTS:

Ocean State Electronics
P.O. Box 1458
Westerly RI 02891
(800)-866-6626 (orders)
(401)-596-3080
(401)-596-3590 (FAX)
Minimum $5, S&H $4, free catalog. Wide array of RF parts, especially air variables and B&W coils, plus kits for most QST projects since 1976. "Non cataloged items gladly ordered." Fast shipping, unless (like me) you don't pay attention to their request that you CALL about air variables and they hold your order for a couple of weeks while they see if they can scrounge up one that they've just gone out of stock on...

Radiokit (store is located at:)
P.O.Box 973 169 Jeremy Hill Rd.

Pelham NH 03076 Pelham NH 03076
(603) 635-2235
No minimum ($3 service charge if under $20), many kits, lots of J. W. Miller chokes & coils, B&W coils, RF switches, Millen variable capacitors, lots of parts in general. Send $1 for the catalog.

Circuit Specialists Inc
P. O. Box 3047
Scottsdale AZ 85271-3047
(800) 528-1417
No minimum with check or money order, $15 otherwise. $3 S&H.
New electronics, good RF assortment, increasing infestation of computers.

Mouser Electronics Mouser Electronics Mouser Electronics
11433 Woodside Ave. 2401 Highway 287 North 12 Emery Ave.
Santee CA 92071 Mansfield TX 76063 Randolf NJ 07869
Mouser Electronics
370 Tomkins Court
Gilroy CA 95020
Catalog Subscriptions: (800) 992-9943 (Continental US only)
Sales & Service: (800) 34-MOUSER (800-346-6873) (US, Puerto R., Canada)
Very complete catalog of brand-new components (though no air variables). Usually quick service, $20 "minimum" ($5 charge under $20).

Digi-Key
701 Brooks Ave. South
P.O.Box 677
Thief River Falls, MN 56701-0677
1-800-DIGI-KEY
No minimum, $5 handling under $25, free and very complete catalog, very nice indeed. Prices aren't always the best, but rarely excessive. Weak on RF specialty parts (though they now have the ever-popular NE602N), but they do have blue LEDs.

Active Electronics
11 Cummings Park
Woburn MA 01801
(800)-677-8899 (US)
(800)-363-6592 (Canada)
$25 minimum, $5 S&H UPS, free catalog. They have 8 stores in the US (Santa Clara CA; Chicago IL; Baltimore MD; Woburn MA; Detroit MI; Mt. Laurel NJ; Long Island NY; Seattle WA) and 9 stores in Canada (Quebec City; Montreal (2); Ottawa; Mississuaga; Winnipeg; Calgary; Edmonton; Vancouver BC). Lots of stuff, oriented more toward supplying last-minute requirements of companies than hobbyists, but perfectly happy to take your money in small doses (stores have no minimum order or shipping&handling). Some items in their catalog are subject to a $25 per ITEM minimum, which is kind of a drag.

Newark Electronics
Send catalog requests to:
Newark Electronics

ATTENTION CATALOG DEPARTMENT
4801 N. Ravenswood Ave.
Chicago IL 60640-4496
(312) 784-5100
They don't have a single mail address or phone; instead, one is supposed to call the closest of three pages worth of branch offices. I don't feel like typing in the entire list (it's copyrighted, anyway :-), so send email for your "local" distributor, or call their administrative offices at the number above. They have a $25 minimum order; they are a Real Distributor, but accept small orders (over the minimum, of course). Their catalog currently 1248 pages; they are very complete (except, of course, for my favorite scarce item, the air-variable capacitor). Note that the catalog prices tend not to match reality all that often, so order by phone rather than by mail; prices tend to be higher than other places, but they have a lot of things that are hard to find from other outlets.

Arrow Electronics, Inc. Catalog requests to:
Catalog Division Catalog Division
1860 Smithtown Ave. 25 Hub Drive
Ronkonkoma NY 11779 Melville NY 11747-9828
(800) 93-ARROW
Minimum $25; catalog cover price is $25 but if you convince them you're with a company they'll probably send one free. They are a Real Distribitor, but also didn't mind my placing a personal order.

MCM Electronics
650 Congress Park Drive
Centerville OH 45459-4072
(800) 543-4330
Minimum $20 ($25 for charges, and they don't take personal checks), handling $1.95 + shipping. Oriented toward repair technicians, really heavy on VCR parts and somewhat overpriced doodads, lots of useful stuff not easily found elsewhere.

Fordham Radio Supply
260 Motor Parkway
Haupauge NH 11788-5134
(800)695-4848
Tools for technicians. One or two items are not outrageously overpriced.

Jameco
1355 Shoreway Road
Belmost CA 94002
(415) 592-8097
$50 minimum order(!), >$5 shipping & handling. Rapidly dumping components in favor of dinking around with computers. Listed for completeness, mostly. Not yet completely irrelevant to the electronic hobbyist, but getting there.

JDR Microdevices
2233 Branham Lane
San Jose CA 95124
Orders: 800-538-5000

Cust. Service: 800-538-5001
$10 minimum, $5+ shipping. Mostly computers now, but they haven't yet decided to abandon components.

Johnson Shop Products
P.O.Box 160113
Cupertino CA 95016
(408)257-8614 (408)996-3240
Catalog $1. No minimum. Shipping charge is based on UPS; very small orders that can be sensibly shipped in a first-class letter, include money for first-class postage. New and some used electronic parts.

DC Electronics
P. O. Box 3203
Scottsdale AZ 85271-3203
(800) 423-0070 (orders)
(602) 945-7736 (stock/price checks)
$15 minimum charge order, no minimum for checks, $3 min. shipping&handling. Wide array of ICs, good assortment of electronic components.

Dick Smith Electronics USA
P.O. Box 468
Greenwood, IN 46142
(317) 888-7265
The American branch of the Australian company. Some parts and kits, mostly new equipment of all stripes (audio, CB, and lots of ham equipment). Prices seemed high last time I checked.

EasyTech Inc
2917 Bayview Drive
Fremont CA 94538-9932
(800) 582-4044 (orders)
(415) 770-2345 (customer Service)
Apparently a brand new company, "dedicated to serving the Electronic Enthusiast/User." $10 minimum, UPS shipping is 5% of order (>= $3).

SURPLUS ELECTRONICS:

All Electronics Corp.
P. O. Box 567
Van Nuys CA 91408-0567
(800) 826-5432
$10 minimum, $3.50 S&H. New and surplus electronics.

BCD Electro
P. O. Box 450207
Garland TX 75045-0207
(214) 343-1770
$1 for 1-year subscription to catalogs, no minimum, $0.95 for under $30, $2.90 shipping. Surplus electronics, pretty random looking assortment.

Fair Radio Sales
P. O. Box 1105

1016 E Eureka St.
Lima OH 45802
(419) 227-6573
Surplus electronics. Heavy on parts for old Collins gear.

Hosfelt Electronics
2700 Sunset Blvd.
Steubenville OH 43952
(800) 524-6464
No minimum, $3.75 S&H. Surplus electronics.

Marlin P. Jones & Assoc.
P.O. Box 12685
Lake Park FL 33403-0685
(407) 848-8236
No minimum ($1 fee for under $10), shipping per UPS. Surplus electronics.

R&D Electronics
1224 Prospect Ave.
Cleveland OH 44115
orders: (800) 642-1123 (tues - fri 9am-4pm sat. 9am-3pm EST)
info: (216) 621-1121
$10 minimum. Surplus electronics.

Surplus Sales of Nebraska
1315 Jones Street
Omaha, Nebraska 68102
(402) 346-4750
New and surplus radio electronics. Wide selection: air variables. At
this writing (8 Mar 91), they are producing a new catalog (and, I gather,
out of old ones).

Tucker Surplus Store
1717 Reserve St.
Garland TX 75042
(800) 527-4642 extension 135
Surplus electronic gear; oscilloscopes and signal generators from the days
when dinosaurs with vacuum tubes roamed the earth (some solid state gear, but
all well used). Prices seem relatively high, and you'll be shocked to learn
how much it costs to ship a 75 pound oscilloscope by motor freight...

American Science and Surplus (formerly JerryCo)
601 Linden Place
Evanston IL 60202
(708) 475-8440
Surplus. *The* surplus place. Lots and lots of surplus. WWII gun cameras,
velcro, laser disk chassis, 6 volt VW wipers motors, LEDs, rubber brains,
you name it, they've had it. Catalogs are a really good time.
$12.50 minimum order (which includes the $4 shipping charge).

SPECIALTY COMPONENTS:

JAN Crystals
2341 Crystal Drive
P.O. Box 06017
Fort Myers FL 33906-6017
(800) JAN-XTAL (Monday through Thursday)
They make crystals. Minimum order is $10, which might be one crystal, or might be two.

Crystek Corporation
2351/2371 Crystal Drive
P.O. Box 06135
Fort Myers FL 33906-6135
(800) 237-3061 (M-F)
They make crystals too. They were the cheapest last time I ordered, but I don't have an up-to-date price list. It took about 4 weeks, and they had said it would take 6.

ICM (International Crystal Manufacturing Co., Inc.)
701 W. Sheridan
PO Box 26330
Oklahoma City OK 73126-0330
(800) 426-9825
More crystals. They were more expensive, but they have lots of pre-made crystals for various rigs, so they would probably be faster.

Amidon Associates
12033 Otsego Street
N. Hollywood CA 91607
Toroid cores and related things. Very fast service.

K2AW's Silicon Alley
175 Friends Lane
Westbury NY 11590
516-334-7024
Free catalog, $10 minimum order. Semiconductors, in particular high-voltage diodes.

Small Parts, Inc.
6891 N.E. Third Avenue
P.O.Box 381966
Miami FL 33238-9980
(305)751-0856
$12 minimum. Mechanical parts, metal stock, Teflon(R) sheets.

KITS:
(The terse "Note:" descriptions are from the ARRL Kit List courteously supplied by Ed Hare and Mike Gruber at the ARRL.)

A&A Engineering
2521 W. LaPalma, Unit K
Anaheim CA 92801
(714) 952-2114
Kits, some components, some books. S&H $4.50, catalog is free with SASE (2 oz

postage).

Antique Electronic Supply
6221 S. Maple Ave.
Tempe, AZ 85283
(602) 820-5411
Note: Broadcast receiver kits

Circuit Board Specialists
P. O. Box 951
Pueblo CO 81002
(303) 542-4525
As the name implies, they specialize in circuit boards; they have circuit boards for a variety of QST articles and ARRL Handbook construction articles. They also have partial kits for most of their boards. The catalog is free, but I had to request it a couple of times.

C.M. Howes Communications
Eydon, Daventry,
Northants NN11 6PT
England
Phone: +44 327 60178
Note: QRP, transmitters, receivers, misc.

Communications Concepts Inc.
121 Brown Street
Dayton, Ohio 45402
(513) 220-9677
Note: kits for Motorola Applications Notes

Dick Smith Electronics
P.O. Box 468
Greenwood, IN 46142
(317) 888-7265
Note: General kits

Down East Microwave
Box 2310, RR#1
Troy, ME 04987
(207) 948-3741
Note: Microwave preamps

Hamtronics, Inc.
65 Moul Road
Hilton, NY 14468-9535
(716) 392-9430
Note: Amateur, general interest

Lake Electronics
7 Middleton Close
Nuthall
Nottingham NG16 1BX
England

Note: Amateur

Mercury Systems
15 Lakeside Dr.
Marlton, NJ 08053
1-609-596-3304
Note: the ARRL Kit list didn't say what they carry; I don't (yet) know either.

Penntek Electronics
14 Peace Dr.
Lewistown, PA 17044
(717) 248-2507
Note: The Neophyte Receiver, QST

Ramsey Electronics
793 Canning Parkway
Victor NY 14564
(716) 924-4560
Amateur radio and hobby kits. The ham kits are all pretty simple and pretty inexpensive, and you get about what you pay for.

{See also RadioKit, Oak Hills Research}

LITTLE GUYS:

Oak Hills Research
20879 Madison St.
Big Rapids, MI 49307
Send $1 for a flyer. Some parts, QST article kits, transceiver kits, QRP stuff in general (they inherited the stock from Small Parts Center when they closed).

KA7QJY Components
Box 7970
Jackson WY 83001
(307)739-1634 evenings
Send a business-size SASE for a current list of parts. RF parts, including vernier drives and air variables. $2.75 shipping, no minimum. My last order took two weeks from when I mailed it and included a note apologizing for the delay!

MANUALS:
Eico Electronic Instruments Co., Inc.
363 Merrick Rd
Lynbrook NY 11563
Note: No current kits, EICO manuals and schematics only

PUBLICATIONS:

NUTS & VOLTS MAGAZINE
P. O. Box 1111
Placentia CA 92670

1-800-783-4624 (subscriptions)
issues are $2.00 (at least, that's the price on the cover), subscriptions are (third class mail, USA:) $12/1 year, $21/2 years, $60/life, (first class mail USA) $20/1 year, (Canada/Mexico) US$22, (other foreign, air mail) US$55. A subscription also entitles you to one free classified ad of 40 words.

Ham Trader Yellow Sheets
PO Box 15142
Seattle WA 98115
"SUBSCRIPTIONS: U.S.: 24 Issues(1 yr) $16.50 50 Issues(2 yrs + 2 issues) $32. 75(3 Yrs + 3) $48. CANADA & MEXICO: 24/$20. 50/$39. 75/$58. FOREIGN: $38 a year sent Airmail. Published 2 ISSUES A MONTH sent 1st Class Mail... NO LONG WAIT FOR AD CIRCULATE! NOTE: A $4/4 issue MINI-SUBSCRIPTION may be ordered by potential subscribers, or WITH AN AD to qualify for the Special Subscriber Ad Rates given below:" Non-subscriber ads $1/{word,number,group} per insertion; subscribers: businesses or other for-profit sales $0.75 per word; ads involving items solely from or for your own use $0.35 a word; hamfest ads $0.35. Ads and ads with subscriptions should be sent to POB 10253 Sarasota FL 34278 during the winter; spring through fall they go to POBox 2057, Glen Ellyn IL 60138.

Howard W. Sams & Company
P.O. Box 7092
Indianapolis, IN 26207-7092
(800)-428-SAMS
Publishers of SAMS PHOTOFACTS and many other electronics books. There is an Annual Index of SAMS PHOTOFACTS whose cost I have forgotten. In-print Photofacts run between $14.95 to $39.95 (for computer Photofacts); they will photocopy out-of-print Photofacts for $11.95 + $2.50S&H for one page, plus $.55 per page thereafter.

RF Design Magazine
P O Box 1077
Skokie IL 60076-9931
(312) 762-2193
A magazine for professional RF designers. Subscriptions are $38 per year in the US, $48 in Mexico and Canada, $51 elsewhere, unless you appear to be a "qualified subscriber" (i.e. are in serious danger of convincing your company to buy a $12,000 spectum analyzer based on an ad) in which case it's free. Heavy on theory, and even the advertisement articles are educational.

OTHER NOTES:

Small Parts Center, listed in a previous version of this message, is now closed, according to a note I just got from them. They say that Oak Hills Research is selling some of their old kits now.

So what does it mean when the SWR increases with the power? I seem to
have this problem presently.

Has anyone noticed that EasyTech's catalog looks an awful lot like Jameco's
in style and presentation? Could it be that this is a parts spinoff
from Jameco (since Jameco is dumping parts rapidly and has become decidedly
unfriendly to hobbiests)? Anyone know if they are related?

Repeaters in Germany use 25 Khz channels with a repeater offset of 7.6 Mhz.
Most european contries use this except Britain. They use a 1.6 Mhz offset.

>the supply side is female and the equipment side is male.

Don't be too embarressed! I still think this is the best idea I've seen yet on this group for standardized power connectors. The only drawback that I can see might be the cost. Seems like (years ago when I worked at a radio station) the prices on these were quite a bit higher than the alternatives that have been discussed. We used the 3 pin versions for all of our microphone connections, and they were quite durable. Some of the cheaper brands would sometimes have problems with the little spring-loaded latch, but we treated them pretty roughly -- especially the non-technical types who did the remotes. The name brand versions (seems like we usually used Cannon) were very reliable.

Also, the idea of supporting multiple voltages is nice, although most of the equipment hams are likely to use will be 12 volt. I know some HF rigs have gone to higher voltages; would 24 and/or 48 volt supplies be useful in these cases?

And, of course, the big question: what is the current rating on these?

-Being mid-way through my studies to become a no-code technician, I purchased
-an IC-24AT. The person that had previsously owned the radio had modified it
-to allow it to trasmit out-of-ham-band. My question is this:

- With the modifications, what are the new frequency limits?

According to one of the IC24 mod files, the new limits are 138-168 MHz for VHF and 410-485 MHz for UHF. There is a lot of variance in the lock range for different radios; these frequencies are approximate at best. Be aware that there are two independant mods, one for each band, and both may not have been done to your radio.

Remember that you should not transmit on frequencies that you are not authorized to, or with equipment not approved for that band.

Did ya ever notice.....

...Why some people refuse to talk over a repeater ID while others just ignore it altogether? What's your preference?

Let the beeps go by themself. its annoying listening to both.

...How some people turn the conversation over with "GO"? (Personally, I think I need a barf bag when I hear this).

Thats preference. If you have a keyup beep (tail-tone, roger-beep, over-beep whatever you prefer to call it) then its unnecessary. On repeaters that have a long keyup tail and no squelch tail it might be usful to have a "go", or a "over".

...That some people think that you are in violation if you don't ID at the _beginning_ of a qso? (Not in the rules ya know...)

You also don't have to give the other station's call. Or the other people's call in the qso. Or the people who "signed out" in the last hour. Or give the other station's call with phonetics. Gagwa, they know who they are!

...That the weather gets talked about more often on the air than in person?

The ones the cheese me off are the OFs that talk about their illnesses, medicines and who died recently.

...That the last person you'll ever hear on a repeater is the trustee?

Not really true in my experience. This may be more true on club repeaters.

...That many hams will switch to high power when you tell them that their modulation is weak (despite the fact that they're already at full quieting)? And that many will say that it's a "little" louder?

or the ones that give you a signal strength report.

1950. Potential Geomagnetic Storm Warning Update - 15 August

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-15 22:48:42 UTC
From: oler@hg.uleth.CA
Message-ID: <0094D2A8.64842E60.18362@hg.uleth.ca>
Source record: 294414

/\

POTENTIAL GEOMAGNETIC STORM WARNING

UPDATED: 22:00 UT, 15 AUGUST

/\

ATTENTION:

Geomagnetic activity over the middle latitudes is active to very active. It approached minor storm levels during the local evening hours of 14/15 August, but failed to surpass the minor storm threshold over the middle latitudes. Minor to major geomagnetic storming has materialized over the high latitude regions. Conditions at the higher latitudes are expected to remain stormy over the next 24 hours.

A risk for geomagnetic storming will persist over the middle latitudes throughout the next 24 hours. Conditions should begin to improve on 17 and 18 August.

Auroral storming was observed over the high latitude and extreme northern middle latitudes on the evening of 14/15 August. Conditions are expected to remain fairly favorable for moderate to high levels of auroral activity on the evening of 15/16 August over the high and northerly middle latitudes. Some equatorward expansion of the auroral oval has occurred. Low latitudes are not expected to witness any activity.

The 10.7 cm solar radio flux skyrocketed 40 points over the last 24 hours, from 175 on 14 August to 215 on 15 August. X-rays have also jumped to healthy C-class levels. No M-class flares have been observed yet, although the probability for M-class flaring is high. The source of the increased solar indices is several active regions which have recently rotated into view around the east limb. There is a threat for brief daytime degradations in HF propagation due to possible M-class flares. There is also a slight chance for an isolated major flare from the east-limb regions. More will be known as they rotate into better view.

** End of Warning **

n5ial/9 de n6uok

dear jim

how about a ramsey kit? if you're comfortable with qrp (and i really mean it -- say 2 watts) and if you are tight on money but handy with soldering irons, then a ramsey kit may be the answer.

the kits come separate between transmitter and receiver. if your old rig can receive on bands other than 20 meters, you can get a qrp xmtr and use your old rig to receive.

not expensive -- each kit only about $40 -- a lot of fun.

by the way, those kits are all monoband and monomode (that is, 40 meters cw only, for example).

good luck and have fun!

It's a carryover from SSB and is short for "go ahead." On SSB, there is no way to tell when the other station stops transmitting without an "over" or "go ahead" (or "go"). It is inappropriate for repeater use since you can tell when the other guy is finished by the "kerchunk" or courtesy beep.

What??
The IARU Region 1 band-plan recommends 1.6MHz offset as far as I know.
This is at least the spacing used in Norway.

>73 Eric WB1HBU @ K1UGM.MA.USA.NA eac@world.std.com

The IARU recommendation for 430 MHz repeater offset is 1.6 MHz with the repeater transmitting on the upper frequency. All Scandinavian countries have the offset according to the recommendation (OH, SM, LA, OZ). Britain has the offset upside down which produces interesting phenomena when good lift conditions occur to Denmark.

Repeaters in Germany use 7.6 MHz offset. I believe some other countries (ON, PA, LX) have adopted the same system. However, I wouldn't call them 'most European countries'. I only wish we had the same bandwidth available as in Germany (430...440 vs. 432...438) so we could adopt the wider offset. I can imagine we could get rid of all the problems associated with narrow offset duplexing by that.

1957. Major Solar Flare Alert - 16 August

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-16 07:55:23 UTC
From: oler@hg.uleth.CA
Message-ID: <0094D2F4.C32C7160.18838@hg.uleth.ca>
Source record: 294427

/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\

MAJOR SOLAR FLARE ALERT

ISSUED: 07:35 UT, 16 AUGUST

/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\

MAJOR ENERGETIC EVENT SUMMARY:

A major solar flare erupted off the southeast limb on 16 August. This event began at 06:15 UT, peaked at 06:21 UT and ended at 06:25 UT on 16 August. This flare was impulsive, and was rated a class M6.7/1B event. There were no significant sweeps (II or IV), although there was a moderate intensity Type III burst (importance 2). The location of this flare was S09E60, within Region 6786.

Region 6786 is an "average" sized region and certainly did not appear capable of producing an event this energetic. It is optically a DAO spot group with a beta magnetic configuration. But it is near the east limb and isn't in an optimum position for observing yet.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT:

This event will not produce any terrestrial impacts. However, the cluster of regions on the southeast limb may provide some interesting and possibly influential activity as they transit the solar disk over the next two weeks.

Further major flaring may be possible from one of the regions in the eastern solar hemisphere over the next several days. The majority of the activity should remain confined to C and M-class levels. This could produce brief disturbances (SWFs) for HF radio communicators over the sunlit portions of the Earth.

/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\/\

1958. Potential Major Solar Flare Warning - 16 August

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-16 08:13:30 UTC
From: oler@hg.uleth.CA
Message-ID: <0094D2F7.4B708F00.18986@hg.uleth.ca>
Source record: 294328

/\

POTENTIAL MAJOR FLARE WARNING

ISSUED: 06:30 UT, 16 AUGUST

/\

ATTENTION:

A major flare on the east limb has prompted us to issue this warning.
We had some concerns that a major flare might erupt from the cluster of
regions now visible on the southeast limb. This last major class M7.6/1B
flare warrants the issuance of this warning.

Isolated major flares may be possible from several regions rotating into
view on the east limb. Region 6786 (which spawned this last major event) is
a slightly possible source for another isolated major flare. So is Region
6784 (S19E31) which has shown a rapid rate of development over the last 24
hours. The cluster of regions 6781 (S19E46), 6782 (S10E49), and 6783 (S14E46)
may also be slightly capable of producing energetic activity of at least an
M-class level.

This warning will remain active until further notice.

>>1 1 1 210 to 235 Mhz

Really? So there is another option for those of us who want a
2-meter/220 dual bander? Has anyone tried this? I would imagine one
would have to do quite a bit of tweeking of the transmitter (and
receiver, maybe) to get the thing to work properly (or do you just
eliminate a frequency doubler somewhere?).

Cost here varies from around 1 UK pound (for a cheap version of the common
3-pin variety) to around 3 - 4 UK pounds for a reasonable quality metal-cased
4-pin. If the 4-pin is available in the cheap plastic option, it's a good
thing - you can use the cheap connectors on cables that (nearly) always stay
connected, and the better ones on cables subjected to rougher treatment.

Personally, I don't think that's excessive - but I might if I had a big box
of cables to replace !

>

>

Disappointing, I'm afraid - the Molex is 12A. Surprising, considering that
the Molex pins are stamped-out tin-plated brass, and the XLR pins are
silver-plated solid brass. Perhaps the Molex ratings rely on better ventilation,
but it's probably due to greater contact area due to deformation of the
contacts.

3 pin XLR - 16A
4 pin - 10A
5 pin - 7.5A

(the 2+earth types are available in 5, 10 and 25A versions, but in view of
their intended use for mains and speaker connections, they seem an unwise choice).

I'd expect many more insertion cycles on the XLR connectors than the Molex,
and the Molex probably drops its current rating fairly rapidly as it gets used,
but neither Molex nor Neutrik (the XLR connectors I was looking at) publish
specifications.

Actually, the discussion's probably past its sell-by date. I was under the
impression that it really was a second-round discussion, but it seems from
email that the standard is pretty well set. Current practice is perhaps more
important than technical suitability.

Use the connector you like and keep conversion cables that will mate them to
the Molex.

-adrian

Sounds like your friend in interested in the Radio Amateur Handbook
from the American Radio Relay League (the national amateur radio
organization in the US). You could write them and order it, or
to get it much faster obtain it from an Amateur Radio Equipment
Dealer.

Looks like you are in California, so you might try
Ham Radio Outlet Anaheim, CA (714) 533-7373
Ham Radio Outlet Oakland, CA (415) 534-5757

From: william@chopin.udel.edu
Message-ID: <17515@chopin.udel.edu>
Source record: 294337
Cross-posted to: rec.radio.amateur.misc,rec.radio.swap

I am interested in any information relating to construction of a radio transmitter. I want to start from scratch and build a respectible transmitter and reciever combination.

Anyone have any ideas where I might look? Specific books or magazines?

Are there any archives on the Usenet which might have info on this subject?

Thanks in advance..

William@chopin.udel.edu

1967. 1050 Hz decode and alert

Request for information

I am looking for an easy circuit diagram or set-up to be
able to decode the weather service's 1050 Hz alert tone and activate
the speaker mike on my ICOM 24AT.
I figure that the circuit will probably be placed within a
speaker mike. I would like the circuit to be able to allow the
tone to pass to the speaker and keep the speaker open until
manually reset.
Any help would be appreciated. Either e-mail myself or place
on the net.

Thanks,
Marc Rosenthal, WB2FGV

> > BNC system to PL-259 or N connectors.
>
> So what does it mean when the SWR increases with the power? I seem to
> have this problem presently.

It means that something nonlinear is happening enroute between the
final tube or transistor, and the antenna endpoints. With tube amps,
this can be attributable to a dependence of Cgp on Ip. Also, many low-power
antenna tuners use toroids whose magnetization curve (in general) is not
perfectly linear; a similar thing could happen within a ferrite balun which
is operating at too high a power or SWR.

Another cause is a poorly balanced directional coupler within
your SWR meter, causing you to _think_ your SWR is changing.
Above 5W you're not likely to observe this.

A gradual increase in SWR during the application of high power
suggests a temperature change somewhere -- i.e., some lossy device
or material is heating up and changing its dielectric or
ohmic characteristics.

1969. PRO 2006 Scan Speed Mod / AR2500 synth of freqs & sorting

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-16 17:20:00 UTC
From: gary@kimbark.uchicago.edu
Message-ID: <1991Aug16.172000.19212@midway.uchicago.edu>
Source record: 294342

Is there a scan speed mod for the PRO2006 ???

Hmmmm..... I've had a PRO2006 for a month or so. I bought this from Grove Enterprises (less expensive than RS). Grove included a mod sheet for the 2006 detailing the various mods (restoring cellular etc). There was no mention of a scan speed mod.

However, at the last meeting of C.A.R.M.A. (Chicago Area Radio Monitoring Assoc.) mention was made of a diode-clip mod to increase the scan rate by about 15%.

I re-read the review of the PRO 2006 in Monitoring Times and although they made mention of increasing the scan rate on the PRO 2005 no mention of this was made in reference to the 2006.

Side effects of this scan speed mod seem to reduce the delay time considerably as well as "miss" weak signals.

Any comments? Anyone made this mod ? Details ?

On a totally different subject.... On at least one of the AOR scanners (AR2500) the manual suggests that one can optimize the channel scan speed by sorting the freqs. What they seem to suggest is that the time to synth a freq is variable and dependent on the "distance" from one freq to another.

In fact, on the AR2500 the micocontroller/processor sorts all the freqs in the channel banks for you - you have no choice. (Kinda bad in a way if you keep track of these channels/freqs with a database)

So, what's the story? Is the time to synth a freq time-dependent as a funtion of "distance" from one freq to another or, is this just a result of the particular implemention of AOR ???

And, by the way, the AR2500 uses an EEPROM to store freqs. Really a neat idea as no battery backup of memory is required.

A review of the AR2500 soon...

Thanks,
Gary

>well clear of everything else.

Mk 3? I used to have a MkII and it was wonderful. Fix this thing! It's worth keeping and will load into an endfed vertical like a champ. Fixing the drive control and using a Pi-L tuner should keep you out of your neighbor's sets. It's about the cheapest way to get on HF and about the best. Once you get it fixed, throttle it back to about 100 watts and it will be clean and mean. It's got one hot receiver.

1984. Looking For Tektronix 475 & 585 Manuals

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-16 23:37:00 UTC
From: nix%muppet.DEcnet@consrt.rok.com
Message-ID: <9108162237.AA01763@ucsd.edu>
Source record: 294346

A buddy and I are looking for a couple of manuals, for some Tektronix scopes. We need a manual for an old 585RM (I think the non rack mount version would suffice), and for a 475.

The 585RM manual is for my friend, and I'm the one trying to get one for my `brand-new-used' 475.

I believe that I can get a 475 manual from Tektronix, although they're asking $ 100.00. If I can't get one any cheaper, I will go that route.

Tucker Electronics, over in Garland (Texas), advertises a whole bunch of used equipment manuals in their `hobbyist' catalog but, when I called them (they're only a few miles from where I am), the guy said that the $ 35.00 (for a Tek 475 manual), shown in the latest `hobbyist' catalog, was for a `spare' manual, and that they've sold it. Tucker says they want $ 170.00 for a Tektronix 475 service manual. Maybe I'm wrong but, this sounds like price `gouging' to me.

Anyone, who has decided to `go' with Tektronix, knows that they're going to be paying a premium price, but they also expect a superior product. Perhaps I should just `bite-the-bullet', and send my money to Tektronix? It's just that I'd like to at least try and keep a little money available ... I've STILL got to buy a couple of decent probes! (yikes, have you price THEM lately!)

Anybody got these Tek manuals, either for a 475, or a 585RM ?

Thanks,

Paul Nix (WB5AGF)

1985. FCC TESTING

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-16 23:48:35 UTC
From: john@edsi.plexus.COM
Message-ID: <1991Aug16.234835.4829@edsi.plexus.COM>
Source record: 294359

Would someone out in Ham-Land have the next test DATES for Wisconsin?

I am willing to travel to take the test so anyone who knows of a NEAR
NOW test date please lt me know the Time, Date, and Place (Directions
from The Fox Cities would be helpfull) Please send them in Mail. the
Unix address's should be in the signature
.

> to know better, but operate poorly anyway.

How right you are, Perry. I've had several nice QSOs on the local repeaters with recent KC6 calls, and I assume that many of these are new Techs without code. As for the experienced lids, let me tell you about my first experience on 1.2GHz last night.

A couple of hams here at Sun recently put a 1.2GHz machine on the air, and one of them was kind enough to loan me his FT-911 for a couple of days. I live "over the hill" from work, so last night when I got home I decided to go exploring the new band from my home QTH. When I found a repeater I could kerchug, I gave my call and asked if there was anyone around who could give me a report. No response. About 30 seconds later, a voice said "WB6LID" (not his real call, although he was a WB6, and he holds an Extra) and nothing more. I called him back and again asked for a report. Here are some of the highlights (sic) of the QSO that followed:

o "Requests for signal reports are the kind of stuff you expect from the two meter crowd. If you can hear the repeater full quieting, then you don't need to ask for a report." (Hmmm. I thought it was a fairly innocous way to look for a QSO on a strange repeater.)

o "Not many of you Novices have found your way up here to 1200." (Actually, I'm a General, but there didn't seem to be much point in mentioning this, so I didn't.)

o "We`re mostly RF types up here. We try to discourage data types." (Well excuse me!)

o After wishing him "73's" in my final, he replied, "There's no "s" in "73". Look it up."

I sure hope that the new Techs are getting a better introduction to ham radio than I got to 1.2 GHz last night. And I hope that this lid is not representative of the attitudes found on 1.2 GHz. If it is, I think I'd rather hang out with the Novices, the "data types", and the "two meter crowd."

1988. Summary of Solar Terrestrial Activity for 16 August

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-17 07:01:32 UTC
From: oler@hg.uleth.CA
Message-ID: <0094D3B6.67D99B40.20087@hg.uleth.ca>
Source record: 294358

PLEASE NOTE

The Solar Terrestrial Forecast and Review for 16 August has been postponed due to high uncertainties regarding possible activity levels over the coming week. For those who need the forecasts contained in this report, consult the STD BBS. All forecasts which would have been released in the STFR report are publically available on the STD BBS at (403) 756-3008.

The following has been extracted from our BBS. It is the daily summary of activity for 16 August. We are placing this on the nets in order to summarize the recent unusual and impressive increases in the solar indices which have been observed over the last couple of days. This will not be a regular feature on the nets. To obtain these publically accessible daily activity summaries, consult the BBS.

/\

DAILY SUMMARY OF SOLAR GEOPHYSICAL ACTIVITY

UPDATED: 02:30 UT, 17 AUGUST

/\

(Based In-Part On SESC Observational Data)

ANALYSIS OF SOLAR AND GEOPHYSICAL ACTIVITY FOR 16 AUGUST

Solar activity has continued to manifest itself over the last 24 hours. The most energetic event was a class M6.7/1B flare from Region 6786 at 06:21 UT on 16 August. This flare was rather impulsive and did not produce a very rich radio spectrum. No Type II or IV sweeps were observed. However, an importance 2 Type III sweep was observed.

Region 6786 (N09E49) was also responsible for an M1.9/2B flare at 00:51 UT, a C9/SF at 18:11 UT, and a C7/SN at 19:05 UT all on 16 August. This region is now the largest region visible at the east end of a cluster of spot groups. This entire cluster of regions has shown some growth and fairly frequent subflaring.

The 10.7 cm solar radio flux increased dramatically again today to 264. This is 49 points higher than yesterdays value and is 89 points higher than what was observed only two days ago. This is the highest the solar flux has been since the measured value of 268 on 14 April, 1991. This significant

increase in the solar flux is due to the continued growth of the large cluster of regions in the southeast quadrant and may also be a response to new regions possibly rotating into view around the east limb.

The solar flux was not the only index to increase today. Both sunspot numbers and the background x-ray flux also exhibited increases. The background x-ray flux increased from a class C2.1 level yesterday to a class C2.8 level today. The observed SESC sunspot number increased from 239 yesterday to 300 today. The sunspot number has increased by 123 points since 14 August.

M-class flare activity should easily be observed over the next several days. Many of the regions in the southeast quadrant could produce M-class flare activity. There is also a fair chance for another major solar flare over the next several days. The greatest threat appears to be Region 6786.

Geomagnetic activity continued to stabilize slowly over the last 24 hours and is now generally unsettled to active over most latitudes. Activity is expected to continue at mostly unsettled to possibly slightly active levels and should continue to stabilize gradually over the next several days.

HF propagation conditions have been mostly good over the low and middle latitudes. However, the high latitude regions continued to experience some degradation from the recent geomagnetic storming which was observed there. Conditions appear to be improving gradually.

Expect some daytime degradation in HF propagation conditions due to possibly frequent flare activity. SWFs will almost certainly be observed for the next several days at least and will likely continue to be observed over the next week or two. Fadeouts could become moderate to strong in intensity during possible major flare periods.

** End of Daily Update **

1989. RTTY DX Notes for week ending 16th August 1991

SB DX @ ALLBBS $KT7H228
RTTY DX Notes 1of3 8/16/91
RTTY DX Notes for week ending 16th August 1991
BID: KT7H228
Part 1 of 3.

A couple of points to ponder on. First, there are now only 14 days
before the date of closure for the logs of the ANARTS Worldwide RTTY
Contest. So send them in to 55 Prince Charles Road, Frenches Forest,
Sydney, 2145 N.S.W. Australia. Immediately.

Second, and as a matter of interest, this week I received reports of
356 stations in 87 countries. You might ask what happened to them.
Well some of them were locals, some are there almost every day, and
some are reported on a fairly regular basis. Which leaves us with
what could be classified as the rarer of the reported ones. At times
the editors pencil gets very blunt.

Our thanks this week go to DJ3IW and the DJ0SPC DX Cluster, G0ABI,
IK5AAX, I5FLN, K4FJ, OD5NG, SP4KM, SP4TKK, TG9VT, UT5RP, VK2EG and
W2FG and the Tri-State DX Packet Cluster Network.

That's where all the information comes from, and we thank them all for
their time scanning the bands. Without them we would not have much.

QSL Information.

3D2MP QSL address is Box 5324, Raiwaqa, Suva, Fiji.

VP2EYF and VP2EXX both QSL via KC8JE, although VP2EXX says for Russians to QSL via UA4FEQ.

A35IM, IJ, IN and LI all QSL via JA3OIN.

9V1XQ. Note the call XQ, not XO as reported last week. Will QSL via K2QBV.

Continued in part 3.
/EX
SB DX @ ALLBBS $KT7H230
RTTY DX Notes 3of3 8/16/91
RTTY DX Notes for week ending 16th August 1991
BID: KT7H230
Part 3 of 3.

VP2E/N2HNQ QSL via his home call of JH4IFF. Do not QSL via the W2 QSL bureau. That also applies to the KH8/N2HNQ operation. QSL via JH4IFF only.

ZK1RY and ZK1XB QSL via HB9DCQ.

3D2RW is ZL1AMO when he is at home.

KG4DD QSL info is PSC-1005, Box 55-692, FPO New York, NY 09593-0053 USA.

EL2FE is via Box 140 Monrovia, Liberia.

3DA0BW is via N5MZH.

C9RKL says to QSL via Box 2524 Maputo, Mozambique.

FR4FR is at 152 Gerges Ponpidocure PK14, 97430 Le Tampon, Reunion Island.

YB0ASX is via K0IEA.

Notes of Interest.

Repeating the information on the VP2E/N2HNQ and KH8/N2HNQ QSL path, all cards must be sent to JH4IFF and not to the W2 bureau. They have lots of cards there, and they will be returning them to the JA bureau in the near future.

No licenses have been issued for Albania as yet. HA9MM and HA0NNN have visited there to clear up a few things they say, but they are interested only in CW and SSB. But keep fingers crossed. There may be RTTY as well.

Latest news of Burma is that it should be activated very soon, maybe in the next week or so.

UL7PCZ is reported to be the first AMTOR station from Kazakh, and reports say that he has plans to visit Vietnam toward the end of the year. He is practicing his RTTY and AMTOR for the trip.

There seems to be some confusion regarding the South Sandwich operation, and who is going. We will worry about that later.

VK0ZA is reported from Macquarie Island.

> And do any of you live in/near Columbus, Ohio, and have an OLD rig
> you want to sell?

The question frequently comes up: "How do I get my Technician class ticket
(the one that doesn't require code tests)?"

The simple answer: "Call the ARRL at (203) 666-1541 and ask for their
Prospective Ham Package. They will take your adress and send you the
package customized for your zip code. It's not the most impressive package
I've seen, but it gives you a list of VEs in your area as well as
information on "What is Ham Radio?" and "How do I become a Ham?" and all
that."

The other simple answer: "Call the W5YI Group at (800)669-W5YI and ask for
their licence preparation material. I haven't had any contact with the
W5YI Group, but I'm told you get your ticket a little earlier when you take
your test at a W5YI session."

The more complicated answer: "You need to pass the Novice and Technician
theory tests at a VE session in your area. Talk to local hams (if you can
find them), check out your local ham store (if you can find one), or call
the ARRL. To get the study guides for the above tests, call the ARRL,
check out your local ham store, or go to Radio Shack for their part numbers
62-2414 "Now You're Talking" or 62-2413 "Nocode Tech License Manual" or
(62-2410 "Novice Class License Preparation" AND 62-2411 "Technician Class
Manual"). The Novice book will from Radio Shack will include morse code
practice tapes, and all of the Novice/Tech study guides will probably
indicate that you need morse code for your Technician license, but don't
panic! The FCC only recently changed the rules (as of February 15, 1991),
but you don't need morse code for the Technician class ticket."

>the single man...

Hi, hi. Perhaps it is attitudes like this, joking or otherwise, which discourage more women from getting involved in the hobby.

By the way, both my husband and I got our Novice licenses at the same time, December 1989 after a class at the local club, and have been upgrading together (we now both hold Advanced licenses). I had decided to keep my Novice call until hitting Advanced because I didn't want a trail of former call signs. Found it interesting how many people assumed that I had a Novice or Tech license when I was a General, while no one made that assumption with my husband.

Our club in Framingham has a number of OM-XYL members, as well as some single women and under-18 girls. On our repeater, you will often hear a husband and wife as part of the rotation in a conversation with other local hams.

We still have more men with unlicensed spouses than women. But I'm finding that some wives who didn't want to get their licenses, period, are starting to consider it as they see the friendly, welcoming atmosphere waiting for them. Incidentally, it has helped some that I have done some personal lobbying showing that ham radio can be INTERESTING -- I have brought some letters & souveniers that ham friends in the USSR have mailed me, for example. This kind of contact for the non-ham looks a lot more worthwhile than "Thank you for the 5 x 9. You are also 5 x 9. Please QSO via the 1990 call book address. QRZ?" TALK ABOUT BORING.

Source record: 294282

The TS catalog for 1992 lists four SW receivers:

NEW DX-390 with 45 station memory BFO digital and 150-29999 Freq for $239.95
DX-440 with 9 station memory BFO digital and 150-29999 freq for $199.95

They claim the 390 is the finest-ever....

Actually, I would recommend something other than a RS for SW reception...

1996. FT-470 Expanded Freq Recieve

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-17 16:04:00 UTC
From: mark@dinsdale.ARmstrong.EDU
Message-ID: <9108171604.AA04159@dinsdale.armstrong.edu>
Source record: 294365

This modification for the Yaesu FT-470 was worked up by Darrel Sego, KM9S, and was given to me by a Yaesu representative at the Jacksonville HamFest.

This simple keyboard modification allows the FT-470 to recieve frequencies between 450 MHz and 500MHz. It does not require opening of the case.

(1) On the main band, program the frequency 450.00 MHz simplex.

(2) Press the [F/M] and then the [RPT] button for offset.

(3) Enter code 0000 into the keypad.

(4) Turn the radio off. Then turn the radio back on.

(5) Press the [RPT] key twice for a "+" offset.

(6) Press the [REV] button one time.

(7) The radio will display 1450.00 MHz. (It does not work at these frequencies. It will recieve up to about 500 MHz.)

(8) Now, store the frequency of 500.00 MHz into the "U" memory. Press the [F/M] key followed by the "down" arrow key to drop the freq 1 MHz at a time.

(9) Store this into "U" memory. Press the [F/M] key for about 1 sec, or until you hear two beeps. Rotate the channel selector until "U" is displayed, then press the [F/M] key again. If "beep" is enabled, one beep will confirm the storage.

(10) Now store 450.00 MHz into memory "L" for the lower of these expanded limits; use the procedure of step (9).

(11) To use the higher frequencies, go to the "U" memory and press the [MR] button to place the radio in memory tune mode. From there, you can scan down or use the channel selector knob to select a lower frequency.

(12) Any selected frequency can be placed into a memory channel.

Note:
Most radios will not let you go up in frequency, only down. Be sure to start at the higher end of the desired range and tune down from there. If you try to go up, the rig will default back to the original ham band.

To rid the radio of this modification, simply reset the CPU. All memory channels and offsets will be lost.

Enjoy and good luck.

73, Mark Eversoll KD4BNF

1997. FT-470 Expanded Freq Recieve

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-17 16:05:07 UTC
From: mark@dinsdale.ARmstrong.EDU
Message-ID: <9108171605.AA04186@dinsdale.armstrong.edu>
Source record: 294366

This modification for the Yaesu FT-470 was worked up by Darrel Sego, KM9S, and was given to me by a Yaesu representative at the Jacksonville HamFest.

This simple keyboard modification allows the FT-470 to receive frequencies between 450 MHz and 500MHz. It does not require opening of the case.

(1) On the main band, program the frequency 450.00 MHz simplex.

(2) Press the [F/M] and then the [RPT] button for offset.

(3) Enter code 0000 into the keypad.

(4) Turn the radio off. Then turn the radio back on.

(5) Press the [RPT] key twice for a "+" offset.

(6) Press the [REV] button one time.

(7) The radio will display 1450.00 MHz. (It does not work at these frequencies. It will receive up to about 500 MHz.)

(8) Now, store the frequency of 500.00 MHz into the "U" memory. Press the [F/M] key followed by the "down" arrow key to drop the freq 1 MHz at a time.

(9) Store this into "U" memory. Press the [F/M] key for about 1 sec, or until you hear two beeps. Rotate the channel selector until "U" is displayed, then press the [F/M] key again. If "beep" is enabled, one beep will confirm the storage.

(10) Now store 450.00 MHz into memory "L" for the lower of these expanded limits; use the procedure of step (9).

(11) To use the higher frequencies, go to the "U" memory and press the [MR] button to place the radio in memory tune mode. From there, you can scan down or use the channel selector knob to select a lower frequency.

(12) Any selected frequency can be placed into a memory channel.

Note:
Most radios will not let you go up in frequency, only down. Be sure to start at the higher end of the desired range and tune down from there. If you try to go up, the rig will default back to the original ham band.

To rid the radio of this modification, simply reset the CPU. All memory channels and offsets will be lost.

Enjoy and good luck.

73, Mark Eversoll KD4BNF

1998. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-17 18:12:44 UTC
From: tkelso@blackbird.afit.af.mil
Message-ID: <9108171812.AA15617@blackbird.afit.af.mil>
Source record: 294368

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space and rec.radio.amateur.misc. This week's elements are provided below.

1999. Uniden BC 70xlt

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-17 20:53:53 UTC
From: msw1633@summa.tamu.edu
Message-ID: <20436@helios.TAMU.EDU>
Source record: 294371

I received a BC 70xlt handheld scanner as a gift from someone who didn't really understand what I had asked for regarding such an item. I have yet to see or hear of anyone else who has one. It is a pretty nice radio but has only 20 memory slots and will not receive aircraft band or 800 MHz etc. Pretty basic.

My question is, does anyone else own one of these, and if so, do you know of any mods? Short of this, I am willing to experiment with this radio, but only in an educated guess fashion. I understand that many scanners use the same chips and circuits as other members of the family (ie BC 100xlt). I am also interested, therefore, in knowing what sorts of components are usually modified in doing such mods, and what are their identifications (that is component types/names) in the BC 100xlt. This might give me a better chance of improving the radio instead of trashing it completely.

Before I receive a plethera of email msgs telling me to look at the hamster mods database, I have done so for the 70xlt anyway. I am really looking for some actual 70xlt mods or some tutelage on the concepts used in modifying the 100xlt so I can choose which mods might be adaptable to the 70xlt.

Also, I have been unable to reach the hamster data base lately, any clues or other sources available?

thanks

2000. IC-W2A audio summary

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-17 21:02:20 UTC
From: ker@cbnewsj.cb.att.com
Message-ID: <1991Aug17.210220.1663@cbnewsj.cb.att.com>
Source record: 294370

A week ago I posted asking what kinds of audio reports people are
getting on their IC-W2As. I had been getting reports indicating
muffled/bassy/hollow etc. audio. As you can see with the enclosed
responses, the general consensus is that the rig has GOOD audio.

I promptly went to my dealer and exchanged my radio. I'm now getting
excellent reports.

By the way, I've heard other W2As, besides mine, on the air with this
bassy audio. Possibly there are other bad ones out there.

Thanks to all that responded!

Response summary follows:

I own a W2A and the new HM-70 speaker mic. Believe it or not I have
better reports while using the internal mic than the external speaker
mic. The HM-70 is a FULL SIZE speaker mic- not a mini version- so it
seems odd to me that it has the worst x-mit audio of the two.

In any case both mics have good audio, no one has ever complained.
>From what I have heard of Icom's manufacturing methods there should be
no difference between the versions audio wise. The only problem could
be a bad mic element- its is possible that yours could have problems.

BTW- others I know have W2A's and their audio is verry good as well.
The little speaker for rx audio..... Well thats a different story.
How good can they make a speaker to fit in a 1" dia. space anyway.

I've had mine now for a couple of months and am, for the most part,
very happy with it. I had some problems when I first got it about
people complaining about my signal quality - but that was just my
getting used to it. Receiver quality is really pretty good as well.
The only complaint I've got with it is the odd power plug.

Sorry to have to say this but my audio reports are fine.
May I make a suggestion & ask that you call someone & get reports
when speaking at different distances from the mike, it may be that
you are speaking too close or to far away from it. I generally try to keep
the rig about 5 to 6 inches from my mouth. If this doesnt help it sounds
like you my have to return it for adjustment or service.

I am getting excellent audio reports and nobody around here is complaining...

I thought I had a problem with my audio while I was on transmit a while back

but I found out that my problem was I was simultaneous dual band receive and
somehow re-transmitting open squelch noise from the other band. Took care of theproblem by
making sure I was in single band mode when I transmit.That's how
I found out I can crossband repeat UHF-To-VHF although I have to manually use the PTT
switch. B.T.W. the VHF-to-VHF crossband repeat mod. works fine on my W2A
let me know if you want it if don't have it yet, I can send it to you...

All of the audio reports I've received on my IC-W2A have been good to excellent.

There is a trick, though. You need to be about 3-4 inches (7-10 cm) from the
radio talking into the speaker. This is done with the top of the radio angled
slightly back such that you are talking into the open parts of the 'slats'
where the speaker audio comes out / microphone input goes in. Doing this
results in a much 'clearer' transmission. The other solution is to use the
HM-70 Speaker-Microphone - it works very well (higher audio output for the
same volume setting than for the internal speaker - no big suprise!).

Well, after some time now some are saying that the transmit audio is
not as good as some other rigs. I know of at least one other fellow
who was told by Icom to send their unit back in for a "simple" adjustment
to correct this. Although audio is a subjective thing, I'm having no real
troubles with mine. People still understand me 100% :-).

The audio in mine is fine, I even recorded it to check because a ham
in europe with a W2E was complaining about his. After checking mine
and my friends out I concluded that they were at least as good as the
audio on the IC-2AT that I have before if not better. The new
speaker-mic, the HM-70, for the W2A (which I also bought) has audio
that is worse than the straight W2A. I think this is due to the fact
that is is hollow and it makes the voice sound more muffled (sp?). In
any case I have never heard a bad report from my W2A but you are the
third person who I have heard from that has had complaints of bad
audio. I am begining to suspect that ICOM may have some quality
control problems in its manufacturing line.

According to a freind (KA1NRH) who owns one, it is only a few of the
early shipments that had the problem. He contacted ICOM and they are
fixing it under warranty. They claim all current production has the
problem fixed.

Three of us bought W2-As at the same time. We are frequently on both simplex
and repeaters. None of us have had any problems reported with audio.

MONDAY AUGUST 19, 1991

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* GALILEO STATUS REPORT *
=========================
August 13, 1991

The Galileo spacecraft is at the HGA (High Gain Antenna) cooling attitude,
operating in the all-spin mode and transmitting coded telemetry at 10 bps.
The spacecraft achieved the cooling attitude at about 22:00 hours, PDT. The
tower temperatures, after 7 hours at attitude, as expected, are cooler than
those observed during the first turn.

Temperatures along the HGA tower are continuing to drop. Today, as of 05:15
PDT, the PWS (Plasma Wave) magnetic field preamp temperature reached zero
DN (approx -95 degrees C), the S-band Feed Horn temperature was -105 degrees C
and the HGA motor temperature was -47 degrees C.

Galileo is planned to remain at the cooling attitude for 50 hours.

[Info via William O'Neil, Galileo Project Manager and Ron Baalke @ JPL]

* DOVE NEWS *
=============
Work on uploading new operating software to DOVE-1/OSCAR-17 continues.
Spacecraft commanding occurred as late as 17-Aug-91 during a pass at
15:38 UTC. Telemetry showed the spacecraft is in good health with the
VHF beacon running at the 2.8 watt power level. During spacecraft
commanding, packet frames such as:

DOVE-1>COMDUV <UI>:
COMMAND 4 ACK

SWITCH>SWITCH <DM>

can be copied interspersed along with the usual telemetry frames.
During periods of commanding on 2-meters, the spacecraft's beacon
remains off the air while receiving commands and only transmits when
it verifies commands from the command station.

* SATELLITE OF THE WEEK *
==========
The "Satellite Of The Week" feature is in response to numerous requests
for amateur satellite transponder passband and beacon frequency information.
All active amateur satellites will be covered in upcoming weeks.

Name : PACSAT-OSCAR-16, NASA Catalog Number: 20439, Launched on 22-Feb-90
Orbit : Low-altitude, circular, sun-synchronous, near polar

PACSAT-OSCAR-16 is a satellite-based digital store-and-forward message system
compatible with terrestrial packet communications. Uplink signals must be
Manchester encoded FM (AFSK) with +/- 3 KHz deviation. The connect address
is "PACSAT-1". The downlink is BPSK, NRZ-I, HDLC, and compatible with AX.25
level two protocol. The current communications data rate is 1200 bps, but
can be switched to 4800 bps at a later date. Transmissions at this data rate
will be straight FSK rather than Manchester-encoded so as to fit within the
passband of a standard SSB voice communications receiver.

Uplinks : 145.900 MHz
145.920 MHz
145.940 MHz
145.960 MHz

Downlinks : 437.051 MHz (primary, raised cosine)
437.026 MHz (secondary, BPSK)
2401.143 MHz (secondary, BPSK, 1 watt)

2003. DJ160 dtmf decode mode keystroke procedure

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-18 02:25:08 UTC
From: wa2ise@cbnewsb.cb.att.com
Message-ID: <1991Aug18.022508.19144@cbfsb.att.com>
Source record: 294374

I crossposted from the Internet to packet a file on DTMF decoding on the
DJ160. Got the below reply to that posting. Looks like there is a
better way. NOTE: I don't have a DJ160, so I can't test or verify this,
so preceed at your own risk. WA2ISE

begin file from packet:
Msg# TSF Size #Rd Date Time From MsgID To
60390 PN 1755 0 15-Aug 1817 KC4WTX 60390_KD6TH WA2ISE ()
Sb: Re: DJ160 DTMF Decode File

I received a message about the DTMF decoding on the DJ-160, and I thought
I should tell you that the process is not that complicated.

1) Put radio on frequency to catch tones to be decoded.

2) Push the DIAL CH button (lower right corner of keypad) The LCD will indicate
the channel currently selected. The channel must be 3 to decode DTMF. If it
is not Channel 3 then use the M button (top left) to change selected channel.
Once you have the M3 in the window you can push the DIAL CH button again to
bring the display back to indicate the frequency. The word DIAL will remain
in the lower right corner of the LCD window.

From this point on any DTMF will be stored in MEM channel 3, but you can not
recieve DTMF while you are looking at MEM channel 3 , you must be looking at
the frquency being displayed while decoding. To see the decoded data, just
push DIAL CH and read the displayed data. Use the frequency knob to rotate
the stored DTMF tones that do not appear. The radio will store 16 digits on
each transmission, but the window will only show about 6 at a time. As the
message indicated, any new data will over write the old...

>when there is a great big one at the begining? Don't they have good lawyers?

The disclaimer you refer to appears only in the internet info-hams digest,
not on the usenet news group.

A lot of people put those disclaimers there because they work for
companies whose lawyers have told them to put the disclaimer there.
Apparently those lawyers assume that readers might indeed be as stupid
as they themselves are, and that the reader NEEDS to be told that
something isn't an official statement of some company that nobody cares
anything about anyway.

As for your second question: there are no good lawyers.
- Brian

STANDARD DISCLAIMER (From petsd!pedsgo!evan Mon Jan 12 15:51:04 PST 1987)

This product is meant for educational purposes only. Any resemblance
to real persons, living or dead is purely coincidental. Sell before
date stamped on carton. Do not purchase if seal has been tampered
with. Contents under pressure. Void where prohibited or taxed. Some
assembly required. List each check separately by bank number.
Batteries not included. Some settling of contents may occur during
shipping. Use only as directed. No other warranty expressed or
implied. Do not use while operating a motor vehicle or heavy
equipment. Postage will be paid by addressee. Subject to CAB
approval. This is not an offer to sell securities. Apply only to
affected area. May be too intense for some viewers. Do not stamp.
Use other side for additional listings. For recreational use only. Do
not disturb. All models over 18 years of age. If condition persists,
consult your physician. No user-serviceable parts inside. Freshest if
eaten before date on carton. Times approximate. Simulated picture.
No postage necessary if mailed in the United States. Breaking seal
constitutes acceptance of agreement. For off-road use only. As seen
on TV. One size fits all. Many suitcases look alike. Contains a
substantial amount of non-tobacco ingredients. Colors may, in time,
fade. We have sent the forms which seem to be right for you. Slippery
when wet. Parental guidance suggested. Do not bend, fold, spindle, or
mutilate. Use unleaded fuel only. For office use only. Not
affiliated with the American Red Cross. Drop in any mailbox. Edited
for television. Keep cool; process promptly. For sale by prescription
only. Post office will not deliver without postage. Return to sender,
no forwarding order on file, unable to forward. Not responsible for
direct, indirect, incidental or consequential damages resulting from

any defect, error or failure to perform. At participating locations only. Not the Beatles, just an incredible simulation. Penalty for private use. See label for sequence. Your mileage may vary. Substantial penalty for early withdrawal. Do not write below this line. Lost ticket pays maximum rate. Your cancelled check is your receipt. Place stamp here. Avoid contact with skin. Sanitized for your protection. Be sure each item is properly endorsed. Sign here without admitting guilt. Items sold separately. Slightly higher in California. Employees and their families are not eligible. Contestants have been briefed on some questions before the show. Limited time offer, call now to insure prompt delivery. You must be present to win. No passes accepted for this engagement. No purchase necessary. Processed at location stamped in code at top of carton. No riders. Shading within a garment may occur. Use only in well-ventilated area. Keep away from fire or flame. Replace with same type. Approved for veterans. Any rebroadcast, reproduction, or other use of the pictures and accounts of this game without the express written consent of Major League Baseball is prohibited. Booths for two or more. >
>Alas, a scope is expensive. I was considering connecting the common
>shack appliances in a new and creative way in lieu of a real analyzer.

The type of scope the average amateur *needs* is not expensive. $20 to
$50 at a hamfest or $300 new. The type of scope an amateur *dreams* of
is expensive, $2,000 to $12,000. Sometimes these show up at hamfests
for $700 to $1,000, *then* the dilemma begins. Should I snap up this
incredible bargain or should I buy that new transceiver? As the proud
owner of two spectrum analysers, four lab grade scopes, three signal
generators, an audio function generator, SMD rework station, meters
for volts, ohms, amps, capacitance, inductance, frequency counters,
dummy loads and wattmeters, antenna impedance bridges, a lathe and
a milling machine you can guess which way my mind works. I could have
bought two IC781s for what I've got tied up in test equipment, but I
wouldn't trade. Good test equipment gives you the tools to build or
repair any type of electronic equipment. A fancy new tranceiver merely
lets you operate an appliance you can't fix and don't understand.

Source record: 294286

Just to add my two cents worth. While repairing my DX-20, I put my Ramsey 1-watter on the air (20-meters). I'm using an indoor longwire, wrapped around the ceiling of a two-story, wooden townhouse. In the course of a little over a week, from Denver, I worked into Washington state, Virginia, Delaware, California, Kentucky, Indiana, Mississippi, Texas, Illinois, N.J., Vancouver, and Regina (Sk). Oh yes, and Minnesota. The California and Washington qsos were multiple station ones.

So now I'm beginning to wonder about all the work I'm investing on the DX-20.

2011. US Forest Service Special Use forms

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-19 06:14:00 UTC
From: fletcher@lode.uwyo.EDU
Message-ID: <9108190613.AA15510@ucsd.edu>
Source record: 294288

I am soon to be filling out the following two U. S. Forest Service forms:

1) Technical Data Electronic Type Land Use (ref: FSM-2700)
2) Special-Use Application and Report (ref: FSM-2712, 36 CFR 251.54)

If anyone reading the newsgroup has leapt through this hoop for an amateur repeater, and has any advice or caveats, or would like to let me know what you put in the various spaces (under duress or otherwise), I would greatly appreciate it. I already have an example of form #1 (filled out for a commercial RCC and paging system provided by the building/system owner). It doesn't look the least bit tricky (always a good reason to worry). Form #2 above is a completely different thing altogether.

Thank you very much!
Reid, WB7CJO

>The one I have in my hand has a bad voice amplifier; no modulation on transmit
>and no sound on receive. It's got a 31-odd MHz crystal in it for government
>use.
<*> If you can't find a manual and you have more then 1 unit then
compare the two with a volt meter. Usually the PTT switch controls
the TX/RX voltages on the WT. Or trace the no-signal back from the
speaker till you find a source using a scope.

You might want to check the speaker since most 100mw units use
this as a microphone also.

Finally B-) (Chuckle) I can't believe you need a manual to fix
this "Nasa Mil-Spec" item.

2015. Potential Geomagnetic Storm Warning - 19 August

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-19 08:15:38 UTC
From: oler@hg.uleth.CA
Message-ID: <0094D553.16D5F6A0.21102@hg.uleth.ca>
Source record: 294292

/\

POTENTIAL GEOMAGNETIC STORM WARNING

ISSUED: 04:00 UT, 19 AUGUST

/\

ATTENTION:

There is a fair chance that geomagnetic activity may surpass minor
storm levels today (19 August). A recent interplanetary shock suspected of
originating from several disappearing filaments has produced minor to major
storming over the high latitude regions. Middle latitudes have remained
mostly active. Conditions may become enhanced during the local evening and
early morning hours of 18/19 August. Periods of minor to possibly brief
major storming are expected during this time frame over the middle latitudes.

Auroral activity has intensified and migrated equatorward over the last
12 hours and is presently over the north to north-central middle latitudes.
Auroral luminosity does not appear to be very high, although the activity
occurring within the auroral oval is rated as high and should continue at
moderate to high levels over the next 12 hours. A return to generally active
conditions can be expected for 20 and 21 August.

A Forbush decrease has been observed with this present disturbance. The
interplanetary shock arrived at 18:34 UT on 18 August. A minor decrease was
observed near 21:30 UT on 18 August, and was followed by a stronger decrease
near 02:10 UT on 19 August. The maximum decrease observed thus far has been
between approximately 3 and 4 percent.

HF radio conditions have become noticably degraded over all latitudes
within the evening and early morning sectors. Less significant degradations
have been observed over the daylit hemisphere. Conditions are not expected
to become significantly degraded over the lower latitudes, although increased
fading, noise and distortion can be expected. The worst conditions are being
observed over the high to north-central middle latitudes where the auroral
oval has expanded to encompass many these regions in the night-sectors.

** End of Warning **

2016. Voice Procedure (was 'why ask why?')

Newsgroup: rec.radio.amateur.misc

From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <19.Aug.91.11
Source record: 294293

>Amen! Please put go in the barf bag along with over, comeback and Yo!

Well *I* consider 'Over' to be proper voice-procedure. I was taught to use 'Over' at the end of transmission, when i was expecting a response from the other station. These things *do* have meaning:- e.g.

(paraphrased from a Royal Signals voice-procedure book dated about 1952; my memory is not perfect however.... but i can always look in the book when i get home....)

'OVER': End of my transmission; i expect a reply from you, and wish to continue working you after your transmission ends.

'OUT': This is the end of my transmission. I will listen for a reply, but do not necessarily expect one.

'OVER TO YOU': I am ending my transmission, and am handing control of the net to you. I will respond to your transmission only if you ask me to.

'OUT TO YOU': I am ending my conversation with you and do not expect you to reply unless i explicitly call you.

'Over' and 'Out' are usually used by 'slave' stations, 'out to you' and 'over to you' are usually used by net controllers.

'Over and Out' is considered heretical, because it means 'i am expecting a reply from you but am not expecting a reply from you'; a tautology which, if practiced on-air, would frequently result in you being expected to do 20 circuits of the parade-ground at the double, carrying a 100lb pack and various other items of militaria.....

Now if only hams were disciplined... would make the pileups on 20 meters far more civilised, and *might* just result in more stations getting to work the exotic DX!!

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 023 (OPDX.023)
August 19, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, WB3LHD, WK3N, K4CEF, K8OSF, W8XD and K8YSE for the following DX information.

3B7, ST. BRANDON. It seems 3B8CF has been denied permission to operate from here. There has not been an operation from here for about 10 years and many DXers need this as a new one. 3B8CF will be on the island, but authorities will not grant the permission. Although some guys in 4-land talked to him on 17 meters one day this week and he still holds out hope for late August or early September operation.

3D2, ROTUMA. Ron, ZL1AMO, continues to travel around the Pacific. He was active from Fiji, but now he is operating from Rotuma. Ron can be found mostly operating CW around 25 kHz from the band edge. Callsign being used is 3D2RW. Also check 3506, 10105 and 18074 Khz. Ron was heard operating RTTY on 14093 kHz around 1130 to 1230z. QSL via ZL1AMO.

4U1UN NEW QSL MANAGER. The Northern Ohio DX Association is pleased to announce that both Jerry, WB8LFO, and Jim, W8CZN, will be handling the QSL chores for 4U1UN. W8CZN will be the call given as manager and WB8LFO will be the one processing the QSL cards. Both WB8LFO and W8CZN as well as NODXA will be shown on the QSL cards. NODXA applications and award information will be mailed out with QSL responses. QSL via W8CZN.

7X5ST/3V8 STATUS. Zedan, JY3ZH, and Terik, CN8ST, reported that they have been in contact with Saad, 7X5ST, and he promised that the documentation for the 7X5ST/3V8 would be OK'ed shortly. Saad has not been in good health for the past few months and therefore has not been active on the bands. Also, Saad lives very close to the Tunisian border and will probably return for another operation after his health improves. Let's hope that Saad's health improves. Maybe a card to his callbook address might help to cheer him up.

T4, CUBA. K6ELX/T4 has been active from Cuba using a G5RV, topping out at 300 feet on a hotel in downtown Havanna. This American news crew is covering the Pan Amm Games. QSL to K6ELX. Other pertaining calls include KK6NE/T4, VY2TX/T4 (op Nick, says QSL via home call) and T40PAN (QSL via Box 1, Havanna, Cuba).

UC, BYELORUSSIA. Dick, UB5MAF, will be signing as RC5O/UB5MAF beginning 20th of August. For SSB listen on 14210 or 21275 kHz and for CW on 14010 kHz around 0400z. This will be from oblast 007. Length of stay is unknown. QSL to Box 1, Lugansk 348034, Ukraine.

VP2, ANGUILLA. VP25EQ is a special prefix commerating the Anguilla Boy Scouts at the World Jamboree being held in Korea. The operator is Paul, VP2EXX and the QSL route is KC8JE. Check the following times and frequencies: around 21010 +/- 5 kHz at 1400 to 2030z, 28505 kHz at 1330z and 14014 kHz at 1045z.

XZ, MYANMAR. A station, Sunday morning, was signing XZ1RS on 21010 kHz at 1427z working European stations. No doubt a slim, but WFWL! Word was going around on several DX Nets that Romeo, 3W3RR, was supposed to leave for Japan on August 16th to rendezvous with other Russian ops, and equipment. From there they go to Myanmar and will start their XZ operation on August 26th. KYFC!!

YA, AFGHANISTAN. Nick, W8XD, heard Saturday night on the 14222 Net from Jim, VK9NS, that he heard Jacky, F2CW is now on the air from Afghanistan. Jacky was reported to have talked to Eva, PY2PE, a few days ago. There are no more details available at this time, except that his best time to be on the air is about 2300z... SO KEEP YOUR EARS OPEN AND FINGERS CROSSED!

ZA, ALBANIA. What else can you say about this one? It seems I did not miss anything while I was away on vacation. The great need for this one is still there. There are so many facts and rumors on what happened to the "HA" boys I feel it is not worth repeating them. Beside, if you are an avid DXer you probably heard them. Well, maybe you did not hear this next item; before leaving on my vacation, Ron, WB3LHD, heard I8YCP state she and her husband will activate ZA sometime in late September to early October. She said no one else will be activating ZA until then, saying they will be the first! (Hmmmm!!!)

ZA LAST MINUTE SCOOP (There is more!). Nick, W8XD, heard Zoli, HA5PP, check into the 14222 Net and told VK9NS the following: ".... Albanian authorities have stated that Albania will be back on the air by Sept. 15th.... Zoli did not say how or who.... He thinks maybe there will be a club station put on the air.... All Hungarians have left Albania at this time... Zoli stated that he left his radio equipment at the Hungarian Embassy and is planning to return to Albania about the 10th of September to try to get final approval/permission to operate..... Maybe he will be a guest operator????..... There was some mention that other groups are trying real hard to get into Albania to operate and there was some speculation that some Japanese may be involved in these plans.....". (ed. Nice scoop Nick.)

ZF, GRAND CAYMEN ISLANDS. ZF2QQ has been very active on the WARC bands this week. Check 18115 kHz around 2030z and 24955 kHz around 1830z. QSL via N4UCK.

HEARD AND WORKED FROM 3 AND 8 LAND....

THE WK3N WORLD DX NEWS........
Unfortunate suffering and tragedies continue in our less than ideal world......... Madagascar, 5R, over 400,000 people clashed with government troops in fighting there. Government troops shot and killed over 50 citizens...... Yugoslavia, YU, 8 more citizens died in fighting in Croatia during a supposed cease fire....... Albania, ZA, milk, bread and meat are almost non-existent as this
economic collapse. Many starving citizens have fled the country to Italy. Italy's president is visiting Albania to help access its problems... All DXers should pray for world peace and solutions... WK3N

2019. Re: QRP transceiver (HF) --- followup to a post, and THANKS TO ALL!

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-19 13:22:42 UTC
From: zjdg11@chi.amoco.com
Message-ID: <1991Aug19.132242.29743@hou.amoco.com>
Source record: 294316

time to combine 2 things into 1. the first bit is to everyone who suggested srcs for QRP rigs. in fact, not counting any postings that I haven't gotten to yet this morning, everyone has pointed me at the same company....

the second bit is more of a reply to gary@ke4zv.UUCP, to which I can't send via e-mail from here.

ok, everyone who suggested that I get the Ramsey kit for QRP --- friday at lunch, I called them. saturday morning, around 0900, it arrived...my kit for a 30m xmtr and a 30m rcvr. saturday night, before I went to bed (more like sometime sunday morning) the rcvr was built and mounted in a cabinet, and the first stages of the xmtr were built. now, the xmtr is also finished.

oddly enough, now that I have a good, working rcvr, my older attempt at a 30m xmtr, which has been sitting around for years due to a minor problem (it tuned very nicely at 20.2 MHz.....) is now also working. seems that sitting around, getting knocked all over the place while moving twice, etc., did it some good. 10 -- 15 Watts, plus full coverage of the band. :-)

this is good, because the 1 Watt Ramsey kit doesn't even produce enough output to move my SWR meter (cheap Rack Shack special) more than a degree or two....and it doesn't seem to be variable in frequency beyond a few kc. (I suspect that with a little checking of the circuit, I'll find that I hosed something up....)

as soon as I can calibrate the frequencies, I'll be ON THE AIR!!!
THANKS TO ALL WHO RESPONDED! the Ramsey kits are very good, IMHO.

now, part 2....

In article <1991Aug16.221308.18150@ke4zv.uucp> gary@ke4zv.UUCP (Gary Coffman) writes:
>In article <1991Aug15.172022.19857@hou.amoco.com> zjdg11@eddie.chi.amoco.com (that's me) writes:

>Drop a wire out the window. From 23 floors up that would make an enviable
>vertical. Wind it back up before dawn so the snoopy neighbors don't notice.

hmmm....that sounds like it'd be well worth trying. only problem is, I've run into people before who tend to take a pair of wirecutters to such things for no apparent reason...and the windows in our building are the bay windows. might just try anyways, though....

[regarding my broken Galaxy V Mk. 3]
>
>Mk 3? I used to have a MkII and it was wonderful. Fix this thing! It's
>worth keeping and will load into an endfed vertical like a champ. Fixing

>the drive control and using a Pi-L tuner should keep you out of your
>neighbor's sets. It's about the cheapest way to get on HF and about the
>best. Once you get it fixed, throttle it back to about 100 watts and it
>will be clean and mean. It's got one hot receiver.

I agree 100 % and then some. when I was in school, people kept telling me
that I'd never work any DX on a rig that old, and that I should just scrap
it. after all, it didn't have 10 thousand types of filters on the audio
side.... :-) they were dead wrong. in fact, I got pretty good at getting
in through pileups --- one call, and "uh, the N5 station, IAL I think it
was...." :-)

but cw is where I'm really at home. and 30m is THE band for cw (IMHO).
the Galaxy V is going to remain in my shack somewhere, even if it is in a
closet until I can get it fixed.

From: abs@nbc1.ge.com
Message-ID: <1991Aug19.154546.22083@nbc1.ge.com>
Source record: 294321

Here's a very simple morse program that I cobbled up one day. It will
run on any Sun, and sends fixed-speed morse via the keyboard beeper.
I'm sure someone can hack it to change speeds, or add variable speeds,
etc.

OK, everyone who has never been a novice (or Novice) and has never made a mistake, send me e-mail. Everybody else, just lighten up a little. This is a hobby. Can you say FUN ?

Sometimes it seems like ham radio these days is a little too close to newsgroup behavior - people sitting around just waiting for a victim to flame. It is pretty daunting for many people to get on the air and start trying to make friends. All this closed society "we'll laugh at you unless you know OUR secret buzzwords" business does NOT help. For every one real lid trying to sound like Smokey and the Bandit, there are a dozen people making plain old honest mistakes. How about helping out newcomers rather than ganging up on them ? Don't attribute to malice that which can be explained by mere ignorance.

Yes, I do appreciate the humor in much of the "why ask why" thread. And I've learned some useful things about today's standard operating procedures.
But I'm also someone re-entering the hobby after a 20 year absence and so I'm learning what it feels like to be a beginner again. So far, I'm mostly sticking to the Novice CW frequencies where people seem kinda friendly and tolerant. Maybe sometime I'll get an HT and start listening and learning politically correct ham behavior before risking a CQ on the local repeater :)

[bunch of possible causes deleted]

Unfortunately there are a couple of "abnormal" things that can cause this too, although they are far more likely if the power goes to 1-2Kw than with 200W.

Anything which causes a change in the cable/antenna system will also change the SWR, this includes arcing of cable, traps, antenna ends as well as corona at the ends of elements.

I burned out a trap on a tri-band beam once, and this was the first indication. The transmitted signal was way down and it cased all knids of TVI too! THe blue flames coming from the trap housings were pretty though :-)

Oh yes, especially at VHF, you can also MELT the cable and cause a short!

2023. Colorado 14er Event

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-19 16:04:22 UTC
From: bobw@col.hp.com
Message-ID: <54420034@col.hp.com>
Source record: 294302

Colorado 14er Radio Event

On August 24th, 1991 a group of amateur radio operators will operate portable from the summits of various Colorado 14000 foot mountains. The primary operating times will be from 10 AM to 12 Noon local time, but operation may occur at other times on that day. The majority of the activity will be on 2 Meter FM with the primary frequency of 146.52 MHz. Activity will spread to adjacent simplex frequencies on 2M and 446.0 on the 440 MHz band.

Radio amateurs are encouraged to work as many of the mountaintop stations as possible. A special event certificate will be available to stations that work any of the mountaintop stations. Log information (including station worked, frequency, time and location) and an SASE should be sent to KB0CY at his callbook address (18070 Sunburst Drive, Monument CO 80132). Although mountaintop stations may choose to work stations via repeaters, only simplex contacts will be recognized for the certificate.

2024. ICOM IC-2410

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-19 16:20:14 UTC
From: ker@cbnewsj.cb.att.com
Message-ID: <1991Aug19.162014.16969@cbnewsj.cb.att.com>
Source record: 294296

The IC-2410 is now out and is being shipped with a multi-color florescent display. An LCD display will be available some time in the future (the ICOM rep I spoke to didn't know when the LCD would be available.)

Has anyone had any experience with the 2410 in an automobile. Is the display visible:

a) On a sunny day when the display is not in direct sunlight.
b) On a sunny day when the display is in direct sunlight.
c) At night (I assume this MUST BE TRUE).

ker@cbnewsj.cb.att.com (kenneth.roser) writes:
>The IC-2410 is now out and is being shipped with a multi-color
>florescent display. An LCD display will be available some time in
>the future (the ICOM rep I spoke to didn't know when the LCD would
>be available.)

Please correct me if I'm wrong but I don't believe that the display is "florescent" on the new Icom rig. Perhaps it uses a florescent panel to backlight an LCD plate, but I can't confirm this.

I recently heard a conversation on HF where some guys were talking about the 850's display being "florescent", "just like the one on the 940". This is not true. Also, some folks think that the original display on the TM-721 was an LED display - also untrue.

The TS-850, TS-450, TM-721, and a great many others, now use LCD displays exclusively.

The average consumer is well familiar with black characters on a silvery whit background - like most digital watches and calculators.

Some radio manufacturers, however, have reversed the color schemes so that the background is black and the characters are light. These characters can be colored with various colored plastic films which when backlit can give the segments a variety of colors. This backlighting can come from ordinary incandecent lights (as on the 721), or sometimes a brighter light source in the form of a flat florescent panel.

There are a variety of tradeoffs between LED, Florescent and LCD displays - with LCD emerging as the overall winner due to its reduced cost and greater flexability of display configuration.

Incidently, I saw the TS-450 down at HRO last Friday. It looked like a nice rig, with the same form factor as the TS-440. My familiarity with the TS-850 put me instantly at ease with the 450's controls. Nice little radio. I doubt the the 440 will be missed for very long. The 3 450's which arrived sold out instantly - one prepaid from a month before. The 450 has many of the 850's features including band and mode stacking registers. For serious mobile work, however, I still think that the black-on-white (e.g. ICOM 735) display is best. I wish that Kenwood would give this type of display a chance in an HF rig.

I've heard a few complaints about the 850's display being hard to see in the shack. Some have complained about the narrow viewing angle (an LCD "feature"), but I can honestly san that I've had no such problems with mine. I also used the rig on field day outdoors

where it was somewhat of a problem with direct sunlight on the display. In the shack, however, I've always been quite pleased with it. I can say that I would like to see more adjustability in the brightness besides Bright and Less Bright.

>When buying a cw filter for an ICOM IC-735 what must one consider when deciding
>upon the 250 Hz or 500 Hz filter? Does the narrower filter cause 'ringing'?
>
I'm not sure what filter selections are available in a 735, but I know it uses the same filters I have in my 761 and those are the same ones that come with a 781. My 761 came with the 500 Hz filter, but the 250 Hz filters were optional. I did fine with the 500 Hz filter until my first contest, and then charged out to get a 250 hz filter. On the first pass, I got one of the two 250 Hz filters (the more expensive of the two--can't really remember which IF stage this one went into). The HRO clerk actually tried to talk me out of buying it, claiming it was too narrow and would cause ringing. In fact, it was terrific! I couldn't imagine how I ever got along without it. Then a couple of CW contests later, I broke down and bought the 250 Hz filter for the other IF stage. Adding it makes the filter skirts much steeper, and the difference is noticeable over having a filter on only one of the IF's. At first it felt too steep, but after trying many before and after tests I have decided I like it much better with filters on both of the IF's. One of my criticisms of the 761 (and I think a 765 works the same way) is that the only choices are no filters, the 500 Hz filter, or both 250 Hz filters; you can't select just one of the 250 Hz filters if you have both of them installed.

Bottom line: you can do fine with just the 500 Hz filter unless you are a serious DXer or contester. In that case, get 'em all!

Used an amplifier of that ilk for several years with my HT in the car. That combo provides a lot of flexibility as you are mobile and can take the HT out portable with you when needed. Found the amplifier made a difference only in extreme fringes of the repeater coverage area. Otherwise, the transmit (5 watt) power of the HT was nicely matched to the receive range. The receive pre-amp in the amplifier was a total waste due to the excellent sensitivity of the IC02AT receiver.

It usually means that your SWR meter is not accurate at low power
levels. Most inexpensive SWR meters read low (closer to 1:1)
at the low-power end of their range.

Bingo.

Don't forget to include a 1/4 wave ground radial for each band you plan
to use. This will help reduce Radio Frequency Interference caused by
RF getting into the power lines, etc. Best solution is if you can
run it in the opposite direction of the "vertical", creating the
equivalent of a half-wave dipole.

>transmitter. I want to start from scratch and build a respectible
>transmitter and reciever combination.

Old issues of Ham Radio magazine are good. There are occasional articles
in QST magazine. "Radio Amateur's Handbook" published by American
Radio Relay League has a number of construction articles as well as
lots of introductory theory and some philosophy. I would think your
library could help with one or more of these.

You didn't mention frequency (range) or power. I trust you know that
transmitters capable of power in excess of milliwatts should be
licensed (and can get you into a lot of trouble if you use them
unlicensed). I suggest you try to contact a local ham organization
for more help and info--assuming this is something for the ham bands.
If you are not already licensed as a ham, they can probably help you
out, and someone is bound to be willing to help you with the problems
you are sure to run into building RF gear if you haven't done it before.

IMHO, the receiver end of the combination is the tougher problem,
and probably the more rewarding one as well if you do it well.

Regards/73, K7ITM

>[the right explanation for VSWR as maximum/minimum, followed by the
>observation that 2*E is the maximum voltage for infinite SWR.]

And a slight addition to my own posting - I should have made it clear that my comments are to be taken in the context of resistive loads only; once we start talking about loads with a reactive component, it *is* possible to get better than 2X the source voltage at various points on the line. I won't spend the time discussing that here, though. However, note that antennas operated off their resonant frequency *do* behave as loads which are at least partially reactive (as expected, since the resistive portion of the load when you're talking about antennas doesn't mean "that which dissipates power" but rather relates to that power which is actually "thrown into space").

One othe minor nit - a poster in an earlier string said something to the effect that an antenna "cut to resonance" was not a purely resistive load, and so it had to be shortended. This is not exactly the right way to say this; it would be better to say that, for example, a dipole cut exactly to one-half wavelength (at the design frequency) is not resonant, due to the inductive effects of the elements. It must be shortened, to somewhere around 95% of the half-wavelength size, to become a purely resistive load and therefore "resonant."

(Thanks to Tom Bruhns for pointing out that I'd neglected to mention the reactive case.)

Any body out there work on antique radios ?

I need help in fixing up a neat old radio. It was manufactured
by Phillips of Holland in the early 60's. Its model number is
BX706A-452, serial: E30939.

The radio, a multi-band receiver (broadcast and sw) works fine
but it needs the tuning scale. The scales are painted on a glass
plate that is about 12" x 6". Most of the scales are gone because
the paint flaked off. To get a new part would be too much to hope
for, but if I could get a picture of scales I could restore them.
Any information on how to contact the manufacturer would be greatly
appreciated.

2037. Radio Shack HTX-202 Info from Horses Mouth

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-19 20:43:21 UTC
From: edg@ESD.3Com.COM
Message-ID: <930@bridge2.NSD.3Com.COM>
Source record: 294231

This material was posted to CompuServe's HAMNET by Ed Juge, W5TOO, who works for Radio Shack. It's reposted to Usenet with Ed's explicit permission. It's my impression that while Ed is speaking with permission of his employer, he's not speaking FOR them.
------HTX202.TXT------
This weekend, August 10-11, 1991, Radio Shack store managers will receive the first copies of the 1992 Radio Shack catalog. On page 68 is listed the Realistic HTX-202 (Cat. No. 19-1120), the "rumored" 2-Meter Amateur HT.

The HTX-202 has 12 independently-programmable memory channels, plus one calling and three priority channels. It comes with continuous tone squelch encode -AND- decode. Power output is 5 watts minimum (7w typical) with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low power setting provides 1 watt output. A power saver circuit with programmable 1/2, 1/4, 1/8, or 1/16-second duty cycle. Batteries are compatible with larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz.) Memories store any offset, and any combination of continuous tone frequencies.

Size is 65 x 117 x 37 mm. To put this in perspective, with alkaline packs on the 202 and my ICOM W2A, both are the same thickness. The 202 is maybe 1/4-inch wider (at widest part), and 1/16-inch taller (it's hard to compare because of the irregular shapes of HTs.) The HTX-202 does give the impression of being a "mid-size" HT until viewed up against something like the little W2A, which actually has three different "widths."

Supplied with Ni-cad battery, charger, 6-cell alkaline battery case, antenna, wrist strap and belt clip, the HTX-202 is catalog-priced at $259.95.

Now, the good stuff...

* True FM modulation (not phase modulation) for outstanding transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz, and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or 16 seconds.

* Multi-function scanning lets you scan standard memories, priority freq. memories, or a frequency range. Resume can be after 10 seconds, when carrier drops, or remain on channel (don't resume.)
* Transmit timeout... if you frequently time-out your local repeater, this circuit will stop transmitting after a preset delay (30, 60 or 120 sec.) and sound a beep. In effect, it forces you to reset the repeater before the repeater times out. Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of downtown Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when the ICOM was quiet... SO WAS THE HT!!!!

Even more impressive, the HT heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because we purposely limited coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end we could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 will be available at participating Radio Shack stores and dealers, nationwide, around the end of September, 1991.

I have posted a separate file (Lib 0 [search on Radio Shack HT]) with comments that will hopefully allay some of the fears (again) about RS selling ham gear. Here is some additional information...
[Ed: See below for file "RS"]

Page 2 of the manual states: "NOTE: You must have a Technician Class or higher Amateur Radio Operator's License and a call sign issued by the FCC to legally transmit using this transceiver. Transmitting without a license carries heavy penalties..."

Page 6 of the manual states that to transmit, you need an FCC license, Technician Class of higher. In bold print, "Do not even think of transmitting until you get your license." It goes on to say, "This is very important. Transmitting without a license is a violation of federal law that can lead to severe penalties. Also, ham operators take the FCC rules very seriously and want nothing to do with bootleggers -- their term for people who operate without a license." It goes on to suggest where one can locate classes, and includes the ARRL address for more information.

The ARRL staff helped prepare this section of the owner's manual.
----------RS.TXT---------
The correctly-rumored impending introduction of a Radio Shack 2-meter amateur HT is causing concern to some who hear it. They seem to see any and everybody on the street rushing into their local RS store to buy an HT, without receiving any indication that a license is needed to transmit.

"Requiring call letters" is meaningless. Many people buy gear while waiting for their license in the mail. There are those who buy transmitting gear for licensed spouses. It's easy to make up a call, or say, "It's for my wife's brother who is a ham, but I don't know his call." Anyone could tell AES or HRO the same thing. I think it was HRO who told me a while back their attorneys say it's probably illegal to require proof of being a ham before selling ham equipment. I have no idea if that's true or not, but it isn't commonly done, and we won't do it either. Dave Sumner at ARRL responded to many inquiring hams (when we introduced the HTX-100) saying we have done more to guard against improper sales than anyone in the business.

The book on the HT stresses the need for a license. In fact, there is a section ARRL helped us write, that addresses that issue. The phrase, "Don't even think about transmitting without a license," is in this book too. Every HTX-100 ad we ran, even in ham magazines, said a license was required. And our salesmakers are reminded 4 times each year that selling any of our products when they know -- or even suspect -- illegal operation is intended, can get them fired, and can subject them to criminal prosecution. There are hundreds of hams at Radio Shack, including the HT product manager and his vice president, both of whom are Extras. None of us are anxious to see ANY illegal operations.

That said... there is no question that a few HTs will find their way into the wrong hands, probably more from being stolen from stores than from "unfortunate" sales. There will be a few of both, I'm sure, due to misunderstanding, smooth-talking customers, or a greedy salesmaker. But no more than would happen through other channels, and a LOT less than happens every day through the hundreds of little 5th Avenue, New York City gray market shops. Remember... the world did not come to an end when RS sold the HTX-100 (to the surprise of many worriers back then.) It won't happen now either. If anyone sees an illegal sale, send me the details... date, time, store, employee name, and circumstances. It true, it won't happen again in the THAT store. 73... Ed Juge, W5TOO, Radio Shack

Well, I tried to figure out the procedure from reading available posts,
but I'm going nowhere fast. Let me explain:

Since (to my understanding) you are now able to do 2m voice without
having to pass a code test, my interest in getting into Ham Radio has
been revived. The thing is, I haven't been quite able to figure out
what the license hierarchy is, and what I need to study for. There are
posts saying 'get the tech nocode book' and 'get the tech and novice nocode
book' etc. etc. Help! Incidentally, I looked in my 1897 ARRL handbook,
and I can't find anything about this. Also, it's probably out of date :-).
I keep it around 'cause it's a good reference.

Thanks! Jim Bogard (jimbo@socrates.umd.edu)

2042. Amateur Satellite Operation Query

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-19 22:10:41 UTC
From: yuan@hcx.rockefeller.edu
Message-ID: <1991Aug19.163028.3051@rockyd.rockefeller.edu>
Source record: 294312

I just passed the codeless Tech exam and am in the process of upgrading to General or more advanced privileges. My interests are in amateur satellite and packet radio operation, in particular using the new PACSAT/LOSATs launched last year. Being new to amateur radio in general and amateur satellite in particular, I would appreciate any comments people may have. A specific query I have concerns the equipment needed for such operation. For example, is a 2m FM transceiver with a simple 1/2 half wave vertical antenna and a 70 cm to 2m receiving converter sufficient for the J-mode of operation on the PACSATs. Also, what type of packet modem is needed for this type of operation. All suggestions are greatly appreciated.

>... If your original
>license predates the changeover to the 3A/3B split, then you need only
>take the 13 WPM code test, otherwise you need to take 3B as well.

You don't have to have your original license, but you do have to have one dated before the change. I had an old tech (originally 1978) that I recently upgraded and I only had the most recently issued license (from an address change in 1982), and that's fine as long as you have a license (original or renewal) that is dated before 1985 (whenever part 3 split into 3A/3B).

The same rules apply to the no-code tech rule changes. If you have a novice or technician license dated before Feb 15, 1991, be sure to keep it when you get a newer license (renewal, address change or tech upgrade) since it it your only proof that you passed part 1A, and it is your "license" to operate below 30Mhz.

2048. Any 23 cm kits available?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-20 10:50:06 UTC
From: benjamin@ee.tut.fi
Message-ID: <1991Aug20.105006.4263@cc.tut.fi>
Source record: 294324
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet,rec.radio.swap

There are dozens of kits available for 2 m and 70 cm from various manufacturers. However, I have never seen anything like a 23 cm FM receiver and transmitter kit in advertisements. I know that e.g. Down East Microwave makes nice transverter kits but are there any simple kits available for just FM use.

The idea is to find an easy way to interlink our node, mailbox and cluster on 23 cm to get rid of all the forward traffic on user port frequencies.

Any info appreciated.

Source record: 294325

I was fortunate to receive a while back a TS690S in lieu of a TS680s. I'm
told that it was the first sold in Canada. The rig is great and I've worked
my way through most of the features except one. Can anyone tell me what
the Advanced Intercept Point (AIP) is, what it does and how it does it ?
I understand that it is a feature of the TS850s which was reviewed in CQ
in June. Unfortunately they do not discuss the AIP function.

By the way, the TS680s is NOT nw available in Canada

Sometimes they come on without identification and then blurt out the truth when someone challenges them. Sometimes they use callsigns that are totally outside the range of possibility in form (Foxtrot Oscar Oscar Lima, delivered phonetically, for one example). Sometimes the conversation is so wierd that you're not surprised when you look the callsign up in the Callbook to discover that it belongs (or belonged) to someone else (e.g., the callsign used the other week by the fellow who had attached an old CB antenna to an Icom 2m unit that someone lent him). And there are a few legal-sounding callsigns that people are on the lookout for as well, just from experience.

myers@hpfcrlm.HP.COM (Bob Myers) writes:

(1.5:1 SWR example deleted...)
>case, NOT 50%. (A simpler way to show this is to consider the VSWR in the
>situation of an ideal lossless line with an open at the load; here
>the VSWR is infinite, but the peak voltage at the load end is only 2X that of
>the "matched" situation.)

I appreciated Bob's comments. They let me look at SWR a little differently
than I had before, and I had thought about it quite a bit before... ;-)

However, you should note that he assumed a "generator" (signal source) that
was matched to the line. This is not generally the case for hams, and
certainly is not when an antenna tuner (maybe it should be called a
"line" tuner instead) is used. In the example copied above, the load the
tuner sees depends on the length of the line, and can vary from a dead
short to an open, being completely reactive (non-dissipative) between.
If your tuner is good enough to tune out the reactance or to drive
significant voltage into an open or current into a short, you can
indeed get far greater than 2X the voltage of a "matched" situation at
the output end. In fact, if the line is 50 ohms, 1/4-wave long, and you
can drive, let's say, 10 amps into it, you will get, I believe, about
500 volts at the open end. But you are not actually putting any power
into the line, because the 10 amps is into a zero resistance: I*I*R=0.

Of course, the discussion was about power ratings of BNC connectors. I
think looking at the power ratings of coaxial cable is instructive: you
may note that the power rating goes down as frequency increases. The
clue here is that the power rating is determined by I*I*R losses that
cause heating of the conductors, and because of skin effect, the losses
go up with frequency. In fact, if you calculate the loss of a
cable like RG-8X/foam, based on resistance of the conductors alone
(no dielectric loss), you will find it comes very close to the
manufacturer's rated loss. So, what about a BNC? Assume 1kW at 50
ohms, matched line. Then the voltage is 223Vrms. I would certainly
trust a BNC with that. Even with a 2:1 SWR, delevering 1kW to a 100
ohm load, the max voltage is 316Vrms or 500Vpeak. As for current
rating, IF the connectors are properly installed, I'd expect no
trouble handling currents like coax with a center conductor about
the same size as the BNC center socket OD, or pretty close to
the same as RG-213; this is especially true if the insulation is
Teflon, with a higher melting point than polystyrene (which is also
used in BNC's) or polyethelene (used in RG-213). The reference in
front of me says RG-213 is good for 1kW at 40MHz. So, I'd say a
BNC should be OK for 1kW in the HF bands, if properly installed.

I'd derate to 500W at 2M and 300W at 440. Those are average powers, so if you are sure your duty cycle and max on time are both low, you could do more; also, if used in a very hot place, derate some. If the dielectric is teflon, this is very conservative: the coax rating chart I used shows a teflon-insulated coax similar size to RG-213 at about 10 times the power--6kW at 100MHz.

I'm glad this thread got me thinking about BNC's. Now that y'all have convinced me, I'll be much more willing to use them for power!

2062. Geomagnetic Storm Alert - 20 August - 2nd Shock Observed

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-20 17:47:58 UTC
From: oler@hg.uleth.CA
Message-ID: <0094D66C.35BF0420.22790@hg.uleth.ca>
Source record: 294234

/\

GEOMAGNETIC STORM ALERT

UPDATED: 14:00 UT, 20 AUGUST

/\

ATTENTION:

A second sudden magnetic impulse, associated with another interplanetary shock, was observed at 08:00 UT on 20 August. This event has increased geomagnetic activity beyond the minor storm threshold for middle latitudes. We are therefore issuing this update to yesterdays geomagnetic storm alert.

Conditions have been at minor to major storm levels over the high and middle latitudes since approximately 09:00 UT on 20 August. This disturbance should end on 21 August. However, activity will likely remain unsettled to active over the next several days.

Auroral activity increased to high levels over the northerly middle to high latitude regions. Activity was observable from the north-central middle latitudes (and possibly in some central-middle latitude regions) to the high latitudes. Equatorward migration of the auroral oval was again evident with this activity.

Activity is expected to gradually return to a more dormant state over the next 24 hours, barring further unexpected interplanetary disturbances.

The cause of this disturbance is uncertain, but may be linked to several disappearing filaments which have been observed over the last several days.

** End of Alert **

Don't be too hard on them. A couple of years back I went into a Radio Shack
to buy a RS-232 cable. The two guys that work there didn't know what I was
talking about. I told them that it was for my IBM and they told that I would
have to go to an IBM dealer to get one. And that they didn't sell IBM
compatible products. This was about 10 years ago. Give them time, when
they get their new products in, they will have to learn what their new toys
do and then they will get their act about it.

2067. HTX-202 Info from R/S Employee (Repost)

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-20 18:32:11 UTC
From: edg@netcom.COM
Message-ID: <1991Aug20.183211.17512@netcom.COM>
Source record: 294239

Dunno if this got out the first time... Indications are that it did
not. If you get this twice, please excuse the bandwidth.

This material was posted to CompuServe's HAMNET by Ed Juge, W5TOO, who
works for Radio Shack. It's reposted to Usenet with Ed's explicit permission.
It's my impression that while Ed is speaking with permission of his
employer, he's not speaking FOR them.
------HTX202.TXT------
This weekend, August 10-11, 1991, Radio Shack store managers will receive
the first copies of the 1992 Radio Shack catalog. On page 68 is listed
the Realistic HTX-202 (Cat. No. 19-1120), the "rumored" 2-Meter Amateur HT.

The HTX-202 has 12 independently-programmable memory channels, plus one
calling and three priority channels. It comes with continuous tone
squelch encode -AND- decode. Power output is 5 watts minimum (7w typical)
with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low power setting
provides 1 watt output. A power saver circuit with programmable 1/2, 1/4,
1/8, or 1/16-second duty cycle. Batteries are compatible with larger ICOM
(IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the
scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz.) Memories
store any offset, and any combination of continuous tone frequencies.

Size is 65 x 117 x 37 mm. To put this in perspective, with alkaline packs
on the 202 and my ICOM W2A, both are the same thickness. The 202 is maybe
1/4-inch wider (at widest part), and 1/16-inch taller (it's hard to compare
because of the irregular shapes of HTs.) The HTX-202 does give the
impression of being a "mid-size" HT until viewed up against something like
the little W2A, which actually has three different "widths."

Supplied with Ni-cad battery, charger, 6-cell alkaline battery case, antenna,
wrist strap and belt clip, the HTX-202 is catalog-priced at $259.95.

Now, the good stuff...

* True FM modulation (not phase modulation) for outstanding transmit
audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are independently
programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective paging
(DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences for autopatch
use or DTMF paging.
* Scan for either active -- or vacant -- channels, with programmable
scanning step of 5, 10, 20, 25, 50 or 100 KHz, and upper and lower scan

limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or 16 seconds.
* Multi-function scanning lets you scan standard memories, priority freq. memories, or a frequency range. Resume can be after 10 seconds, when carrier drops, or remain on channel (don't resume.)
* Transmit timeout... if you frequently time-out your local repeater, this circuit will stop transmitting after a preset delay (30, 60 or 120 sec.) and sound a beep. In effect, it forces you to reset the repeater before the repeater times out. Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of downtown Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when the ICOM was quiet... SO WAS THE HT!!!!

Even more impressive, the HT heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because we purposely limited coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end we could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 will be available at participating Radio Shack stores and dealers, nationwide, around the end of September, 1991.

I have posted a separate file (Lib 0 [search on Radio Shack HT]) with comments that will hopefully allay some of the fears (again) about RS selling ham gear. Here is some additional information...

Page 2 of the manual states: "NOTE: You must have a Technician Class or higher Amateur Radio Operator's License and a call sign issued by the FCC to legally transmit using this transceiver. Transmitting without a license carries heavy penalties..."

Page 6 of the manual states that to transmit, you need an FCC license, Technician Class of higher. In bold print, "Do not even think of transmitting until you get your license." It goes on to say, "This is very important. Transmitting without a license is a violation of federal law that can lead to severe penalties. Also, ham operators take the FCC rules very seriously and want nothing to do with bootleggers -- their term

for people who operate without a license." It goes on to suggest where one can locate classes, and includes the ARRL address for more information. The ARRL staff helped prepare this section of the owner's manual.
----------RS.TXT---------
The correctly-rumored impending introduction of a Radio Shack 2-meter amateur HT is causing concern to some who hear it. They seem to see any and everybody on the street rushing into their local RS store to buy an HT, without receiving any indication that a license is needed to transmit.

"Requiring call letters" is meaningless. Many people buy gear while waiting for their license in the mail. There are those who buy transmitting gear for licensed spouses. It's easy to make up a call, or say, "It's for my wife's brother who is a ham, but I don't know his call." Anyone could tell AES or HRO the same thing. I think it was HRO who told me a while back their attorneys say it's probably illegal to require proof of being a ham before selling ham equipment. I have no idea if that's true or not, but it isn't commonly done, and we won't do it either. Dave Sumner at ARRL responded to many inquiring hams (when we introduced the HTX-100) saying we have done more to guard against improper sales than anyone in the business.

The book on the HT stresses the need for a license. In fact, there is a section ARRL helped us write, that addresses that issue. The phrase, "Don't even think about transmitting without a license," is in this book too. Every HTX-100 ad we ran, even in ham magazines, said a license was required. And our salesmakers are reminded 4 times each year that selling any of our products when they know -- or even suspect -- illegal operation is intended, can get them fired, and can subject them to criminal prosecution. There are hundreds of hams at Radio Shack, including the HT product manager and his vice president, both of whom are Extras. None of us are anxious to see ANY illegal operations.

That said... there is no question that a few HTs will find their way into the wrong hands, probably more from being stolen from stores than from "unfortunate" sales. There will be a few of both, I'm sure, due to misunderstanding, smooth-talking customers, or a greedy salesmaker. But no more than would happen through other channels, and a LOT less than happens every day through the hundreds of little 5th Avenue, New York City gray market shops. Remember... the world did not come to an end when RS sold the HTX-100 (to the surprise of many worriers back then.) It won't happen now either. If anyone sees an illegal sale, send me the details... date, time, store, employee name, and circumstances. It true, it won't happen again in the THAT store. 73... Ed Juge, W5TOO, Radio Shack

>Also, what type of packet modem is needed for this type of operation. All
>suggestions are greatly appreciated.

All the pacsats except DOVE use PSK for their downlinks. You need a SSB
receiver to copy them. A converter from 435 Mhz to a 10 meter HF receiver
will work or a 70 cm multimode radio will work. The Manchester encoding
used on the uplink can be done with a FM rig. The vertical will work on
parts of some passes, but you'll be happier with a Lindenblad (sp) for
reception. They're easy to build out of TV twinlead and some supports.
PVC pipe works well. This is a circular polarized omni-directional
antenna.

The necessary PSK modem is available as a kit from Radiokit or TAPR.
Or you can get an assembled system from Pac-Comm in Florida. I have
the Radiokit. The TAPR is supposed to be better, but a friend of mine
has one and my system works better than his. This could reflect the
difference in our kit building skills more than a difference in the
modems though. The modems offer automatic doppler tracking if your
radio has up/down tuning buttons on the mic that work in 100 hz or
less steps. Since lightning wiped out my satellite station, I've
been limited to just listening on my little IC402 and tuning manually.
Works pretty good. When my IC970 comes in, look out, I'll be back on
the satellites with a vengence. I've got my new KLM 22c and 40cx
mounted on the new Yaesu 5400 alt/az rotor fed by hardline and I've
got new 2m and 70 cm preamps and amps. Thank you State Farm.

2069. ICOM IC-2410 expanded frequency coverage

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-20 20:38:45 UTC
From: ker@cbnewsj.cb.att.com
Message-ID: <1991Aug20.203845.3564@cbnewsj.cb.att.com>
Source record: 294242

The ICOM IC-2410s receive frequency range can be extended by clipping
3 diodes on the logic board as follows:

D8 320-399
830-950

D9 118-135

D10 400-479

DISCLAIMER: I do not currently own this radio and have not personally
performed this mod. This information was provided to me by ICOM but
I offer no guarantees on its accuracy.

SEELER@upei.CA (DR. D. SEELER, VY2DCS, SEELER@UPEI) writes:
>
> Can anyone tell me what
> the Advanced Intercept Point (AIP) is, what it does and how it does it ?

From reading the QST review of the TS-850, I inferred (with possible error) that AIP simply means "front-end attenuator".

No kidding.

I tried to find anything in the review which might suggest otherwise, but it appears that Kenwood is playing an old Madison Ave. trick; it is true that in many receiver designs, insertion of loss at the front-end will increase the input-referred 3rd order intercept point (a.k.a. 3IPI), but I would hardly call it a feature.

The 3IPI is a measure of weak-signal receiver performance when strong nearby signals are present.

Useful comparisons of 3IPI should be made with preamps on and attenuators off. QST measured it with the AIP on & off.

sigh

>I've never heard one of these. Do they just come on and not identify
>themselves or how do you know they are unlicensed?

The one time I was sure I was hearing an unlicensed ham, he used a call
sign that was not yet issued. In fact it was N9SFV and we nicknamed
him amongst a few of us N9-Sounds Very Fishy.
He did not stick around long but did have the best of manners, better
than most hams... not that I condoned his operating without a license.
By the way, this was on a Chicago repeater... not a 3-lander.

2073. Radio Shack PRO-34 Scanner

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-20 21:29:31 UTC
From: david@unity.ncsu.edu
Message-ID: <1991Aug20.212931.11167@ncsu.edu>
Source record: 294248

This is my first posting to this group and I am relatively new to the scanning hobby, so bear with me...

I just bought a Radio Shack PRO-34 about 2 days after their new catalog came out. The PRO-34 was updated for their new catalog year with a faster scan speed of 50ch/sec (I think). The store didn't have any of the new ones, but last year's was on sale for $229, down from $299. I'm sure most RS's still have some old ones.

Does anyone have a list of mods that can be made to this scanner? Anything like speed or modifying the available freqs?

Source record: 294249

Yes, it's easy to marvel at the conversations one can hear on a two-meter repeater. I have a couple of favorites to share with the net.

Heard on a repeater in Anchorage: "You're full quieting, OM, and you should get even better when you get closer to the repeater!"

Barf-out word: Destinated. As in "Well we're just about destinated here, so I'll say 73 and see you tomorrow."

The original post noted that the trustee of the repeater is the last one heard, and that's often the case. As a repeater trustee myself, I monitor almost 24 hours a day and am heard yakking on the machine nearly every day. Hardly anyone ever suspects that I'm the trustee, since few two-meter enthusiasts can copy the CW ID at 15 words per minute. Anyone who is critical of the trustee should try being a control operator for awhile and see how they like it. My pet peeve is the lid who brings up the autopatch, dials a number, gets a busy signal or whatever, and never once announces his callsign. If I'm near enough to the rig, I try to bring down the patch immediately--often with a terse admonition. Bringing up the patch without announcing one's callsign is comparable to breaking into someone's house and using their telephone without asking permission. I like to know who's using the repeater, and whether or not they have an amateur license--particularly if they use the autopatch, since that's third party traffic. As the trustee, I'm the first one to whom the FCC would send a notice of violation if the autopatch is abused.

I also agree with the person who speculated that the trustee is usually busy programming exciting new voice-synthesizer chips so that the repeater can sound like a rock-jock. We had that problem on a local club repeater here in Juneau. The talking sandpile got to be so irritating that another group of us started our own repeater. *Our repeater* has no annoying voice announcements, and no "courtesy" tones. No beeps, no pops, no whistles--just human voices, with all their frailties. We also have a fragmented club, with those who like to listen to synthesized voice on their repeater, and those who don't... .....Oh, the price of progress!

Another observation: It seems to be much easier to find folks to program the talking chips than to find someone with experience in RF who can keep the repeater working up to spec, or someone willing to climb the tower to do maintenance & repair on the antenna! Ever notice how many two-meter repeaters have

noticeable desense? They're called alligators--huge mouth, very small ears. Now to get rid of the occasional intermod......

Keep smiling.

2078. Does RF Antenna Paint Exist???

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-21 00:30:01 UTC
From: green@berlioz.nsc.com
Message-ID: <1991Aug21.003001.25284@berlioz.nsc.com>
Source record: 294252

Hello Everyone: -
Due to a number of sensitive issues in dealing with HF radio in a small complex, I am looking at possibly painting my HF antenna to help it "blend-in-better" with the surrounding environment.

A first order effect is that the paint should have little, if any impact on the antenna characteristic impedance, and, that no RF absorption should take place.

In addition, the paint should serve as a sealant against oxidation and corrosive effects. There are probably many other positive and negative effects the paint may have on the antenna as well.

Any thoughts, comments suggestions or information regarding this issue would be appreciated.

Thanks in advance.

This reminds me of an occurance on one of the local repeaters in my area a few months back when a "WA6" operator showed up asking some very unsophisticated questions, explaining that he had just gotten his ticket "about six months ago." A couple of the more savvy regulars encouraged him to attend the club meeting that would be held that week. Never did find out if he was dumb enough to show up....

I wouldn't count on that. Maybe you never met any real two-meter enthusiasts. People who spend their days yakking on a repeater are not what I would call VHF enthusiasts. Most VHF people I know (including myself) can copy even a real CW QSO at 15 WPM. Some can do that at higher speeds, too...:-)

>should try being a control operator for awhile and see how they
>like it. My pet peeve is the lid who brings up the autopatch,

No, nononononono! Never, never allow those people in control again! And you should have two trustees like we have, it gives you strength.

My favourite lids are:

1) The old farts who seldom ID themselves on the repeater. If they do, they are something like 1OU or 3PH (does anyone know which country has the 1O or 3P suffix?)
2) The old farts who begin with "Is there aaaaaanyone on the repeater ...(beep)...Seeeeems to beee a quieeet day today...(beep)...Aaanybody on the frequency...(beep)...". I wonder why more than 15 years on the machine can't teach you anything.
3) Alligators. I know some people who run 100 Watts to a gain vertical to hit a repeater only few miles away. They never realize that they

very often manage to kerchunk our machine 100 miles away, too.
4) Ex CB yakkers who just have moved 118 MHz up (anybody knows how many channels this is?) and still keep up with CB jargon and CB manners.

>dials a number, gets a busy signal or whatever, and never once

The same applies to the kerchunkers. Is it really so hard to say "OH3BK testing" if you just want to know that you can hit a particular repeater.

>synthesized voice on their repeater, and those who don't...
> ....Oh, the price of progress!

Isn't it nice to have *an own repeater*? BTW if it was the club repeater wasn't it possible to get the users' opinions heard at the annual meeting? I personally think a repeater is too small and unimportant a thing to start the famous "Club Wars". However, I agree with your opinion on the bells and whistles: the less the better. The meaning of a repeater is to enhance mobile communications, all additional features are more or less caused by regulators or individuals with idle minds...:-)

BTW when we young guns got tired of the bad repeater and the OF trustee ten years ago, we moved to simplex. There are no bells and whistles either...:-)

>
>Another observation: It seems to be much easier to find folks to
>program the talking chips than to find someone with experience in
>RF who can keep the repeater working up to spec, or someone
>willing to climb the tower to do maintenance & repair on the
>antenna! Ever notice how many two-meter repeaters have
>noticeable desense? They're called alligators--huge mouth, very

>small ears. Now to get rid of the occasional intermod......

True, true, true! But usually the people with basic knowledge on
duplex radio systems do things that are much more interesting and
technically challenging than a phone repeater...:-) After all, they
invented it in the '40s, it's a piece of cake to put up a repeater,
or is it? And if you notify a trustee with a desense problem (yes,
with a little experience you can hear it if you listen to a mobile
with a weak signal, the noise sounds different and the fading is
different) you usually get: "It works well enough, I have full quieting
all the way commuting home from work. Besides, we don't have the time,
money and equipment to make it better." And that is just what you get
from me if you ever complain of our machines...:-)

Besides, think of the positive side-effects of repeater desense:
isn't it nice that the drunkie OF from the neighbouring town can't
hit the repeater any more?

>
>Keep smiling.
>Herb Holeman, WL7BIL
>Juneau, Alaska
>jshch@alaska.bitnet

I try. At least with some additional Band-Aid below the ears at some
of the club meetings :-)

2088. W2A, what are the extended RX ranges?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-21 13:18:53 UTC
From: russell@cbnewsd.att.com
Message-ID: <1991Aug21.131853.2982@cbnewsd.att.com>
Source record: 294263
Body handling: HTML body converted to readable text

I just got my Icom W2A. I did the 4 key press modification
(<#>) to enable the extended RX range. I also
did the programing to allow entry of all of the digits on both UHF and
VHF side of the radio.

In past postings, I have seen conflicting information as to what the
real RX frequency coverage is. You can input numbers from 00.01Mhz
to over 1300.00Mhz but you obviously can't receive all of that.
My unit seams to receive the frequency ranges of about
118.00-170.00Mhz, 322.00-513.00Mhz, and 800.000-970.000Mhz.
I have not verified these ranges extensively, but this seams
correct. Also, I have seen these ranges posted on the NET in the past.
Another person posted sensitivity ratings of the W2A on the NET for
RX and they stated ranges of about 60-395Mhz, 395-525Mhz,
530-690Mhz and 700-999Mhz.

What should I expect my radio to receive? I can't imagine that individual
radios could be that different. Were the first ones different than what
is being sold now? Did I perform the wrong key presses?

Thanks for any help,

>
>Thanks! Jim Bogard (jimbo@socrates.umd.edu)
The question frequently comes up: "How do I get my Technician class ticket (the one that doesn't require code tests)?"

The simple answer: "Call the ARRL at (203) 666-1541 and ask for their Prospective Ham Package. They will take your adress and send you the package customized for your zip code. It's not the most impressive package I've seen, but it gives you a list of VEs in your area as well as information on "What is Ham Radio?" and "How do I become a Ham?" and all that."

The other simple answer: "Call the W5YI Group at (800)669-W5YI and ask for _their_ licence preparation material. I haven't had any contact with the W5YI Group, but I'm told you get your ticket a little earlier when you take your test at a W5YI session."

The more complicated answer: "You need to pass the Novice and Technician theory tests at a VE session in your area. Talk to local hams (if you can find them), check out your local ham store (if you can find one), or call the ARRL. To get the study guides for the above tests, call the ARRL, check out your local ham store, or go to Radio Shack for their part numbers 62-2414 "Now You're Talking" or 62-2413 "Nocode Tech License Manual" or (62-2410 "Novice Class License Preparation" AND 62-2411 "Technician Class Manual"). The Novice book will from Radio Shack will include morse code practice tapes, and all of the Novice/Tech study guides will probably indicate that you need morse code for your Technician license, but don't panic! The FCC only recently changed the rules (as of February 15, 1991), but you don't need morse code for the Technician class ticket."

>of months for NORTH CAROLINA.
>
>Thank you in advance,
>Harry Nicholos

To Harry and anyone else in the North Carolina area...VEC exams will be offered at the Shelby Hamfest to be held August 31 and September 1, 1991.

The 'fest will be held at the fairgrounds of US 74 (Business) in Shelby, N.C. - talk-in will be 146.88/146.28 MHz. A note to the Shelby Amateur Radio Club might be in order to ensure which of the two days exams will be given. Many 'fests now test on only one of the two days (usually Sunday).

This is a large hamfest. If you've not made room reservations, plan on a one hour drive to the site.

Tickets are $4.00 at the door/$5.00 at the gate. Order from
SARC
P.O. Box 2206
Shelby, NC 28150
enclose a SASE with your check.

No relation to their club; I'm just going as well!

Those ranges are correct, but it doesn't mean the radio is sensitive enough for anything at the extremes.

Nope, you did em' right. For example, I dialed in 224.0 just for kicks (on both VHF and UHF sides... only the VHF side worked of course). I could hear my friend's 220 HT (.7 watts) full scale 5 feet from me. When I moved 20 feet from him, he was barely above noise. Again, no sensitivity in the extreme ranges, just like the 24AT. Oh well....

2096. True FM vs. Phase Modulation ?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-21 16:39:41 UTC
From: bobw@col.hp.com
Message-ID: <54420037@col.hp.com>
Source record: 294275

The following appeared in the recent RS HT discussion and the same comment shows up every so often:

* True FM modulation (not phase modulation) for outstanding transmit audio and best performance in packet service.

OK, so what's the big deal about "True FM"? A few years ago, I researched the issue of Phase Modulation (PM) vs Freq Modulation (FM). I managed to locate the EIA standard for mobile radio modulation and discovered that the industry standard modulation scheme is actually PM. (You may recall that FM and PM are both forms of "angle modulation" and that one can be derived from the other with appropriate shaping of the audio frequency response.) Therefore, if a radio has an FM modulator in it, it would need to shape the audio such that the emitted RF is consistent with the PM standard. Another way of looking at it is that independent of the modulator type, the user should perceive that the audio to RF translation of the transceiver is always the same (and should be PM).

Any well-informed and non-flaming insight into this topic would be greatly appreciated.

You are in error.

>I tried to find anything in the review which might suggest otherwise, but
>it appears that Kenwood is playing an old Madison Ave. trick; it is
>true that in many receiver designs, insertion of loss at the front-end
>will increase the input-referred 3rd order intercept point (a.k.a. 3IPI),
>but I would hardly call it a feature.

The QST review of this radio was sadly inaccurate, and it was clear from reading it that the reviewer simply did not understand what many of the features were and how the properly operate them. It seemed like the person was rushed for time and just wasn't interested in doing a good job. I had purchased an 850 a couple of months before the review came out (one of the first in the area, having sold my trusty TS-930S), and I remember thinking that the reviewer must have gotten a lemon or was reviewing the wrong radio.

Anyhow, the Advanced Intercept Point is NOT just an attenuator (the 850 actually has a 6dB and a 12dB attenuator, which can be cascaded for a total of 18dB). I am not a receiver designer, but I do consider myself an experienced dxer/contester. While there is about 1dB or so of 'insertion loss' when the AIP is turned on, the improvement in the signal to noise ration is dramatic. On 40, 80, or 160 it can be the difference between hearing summer thunderstorms with a hint of someone buried under S9+ static, and having the frequency jammed with DX several dB above the noise floor. I don't know how they do it, but it is NOT a "front-end attenuator".

The 850 is e wonderful radio, and I have no regrets selling my TS-930S to get it (You would have NEVER heard me say that a year ago).

I hope this is not a real stupid question, but I figure someone will help me.

I've been reading this newsgroup alot and to tell you the truth most of the time I am lost. I got into 'scanning' a few months back and I just have lots of questions. Most things I can figure out after more reading, etc. but this is really gnawing at me.

I have been seriously looking at buying a carphone, however, I just have a feeling that there might be away to acomplish what I want through radio.

Is there a way to patch through my home phone, to make telephone calls from my car while I'm in the local area.

What type of equipment would it take? It would need to be totally automated from the home end.

How expensive would it be? What kind of voice quality would such a system have.?

I suppose I'd need a license , what kind , how much would it cost?

Thanks for any help you can offer.

How true! I'll not start on standards, other than to say "standards are
a great thing - everyone should have one" and "The great thing about
standards is that there are so many to choose from" :-) (source unknown).

>Use the connector you like and keep conversion cables that will mate them to
>the Molex.

Just be sure to have enough conversion cables to convert everything, or
do what I did and make a one-to-many cable, using your standard connector,
and then you only need one conversion cable per type of connector - assuming
that all connectors involved can handle the current.

As you watch the drama unfolding on the streets of Moscow, you can't help but notice that this struggle against an attempt at totalitarian suppression is being waged not with guns, but with words and ideas. And as of this moment, those words are standing up pretty effectively to the tanks. I don't know about the rest of you, but my heart is in Moscow these days. Through the radio in my study I met a lot of Russian radio amateurs, and as the friendships deepened I finally had a chance to spend some time with several of them there in their homes. That was an eye-opening experience that has given me a strong emotional tie to the Russian people. Today I count quite a number of them among my best friends. I'm sure the same is true for many of you as well.

This morning on CNN I saw coverage of the station (R3A) that a bunch of the Russian hams set up in the Russian parliament building. Quite visible in those scenes was the old FT-101 that I know was dragged over from the Moscow University Radio Club. Next to it was a lot of the typical homebrew equipment those guys put together from whatever scrap they can scrounge. After the KGB seized all of the broadcast stations, shut down the independent press, and isolated Boris Yeltsin inside the Russian White House, there were the Russian hams setting up their own station to get Yeltsin's words out to rally the people against this coup. And rally they have! It seems to me that we've got some real heros in our ranks over there.

Just pondering the obvious power of amateur radio in this conflict, it occurs to me that so many of the 4th Ammendment type arguments I hear against gun control in the U.S. are really much more applicable to the possession and use of radios today. The Russians as a whole are a pretty well-armed people (shotguns only--rifles are very carefully controlled). But they are not trying to wage war (so far) against the tanks with those guns. Instead, it is the individual people pulling together to show mass support for democracy that is coming to be the undoing of the "Emergency Committee". And one of the most effective weapons I see them using in pulling together that show of mass support is amateur radio equipment. Whenever these #&%$!@ flares die down, maybe we can find out who the operators of R3A are. Anybody know anything yet?

You might try gold leaf paint. It may or may not blend in well (depends upon the neighborhood) but should meet all your other criteria. Definitely stay away from lead based paints unless you have serious noise problems. The lead based paint could act like a faraday shield - if you leave a small area unpainted and ground the paint (only).

55 is an Europien MSG. code like we have in ARRL MSG. code book.
It means: "Best wishes to you and your family"

from the log of AA6AD

2107. A Callsign Project Club?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-21 23:05:59 UTC
From: rusty@anasaz.UUCP
Message-ID: <4743@anasaz.UUCP>
Source record: 294187

Well, I once again have time to post, so I'll spew forth a bunch
more stuff about callsign projects and such.

Similar format to last time, I'm replying to a bunch of things...

!Path: anasaz!asuvax!cs.utexas.edu!wupost!zaphod.mps.ohio-state.edu!ub!bowen
!From: bowen@cs.Buffalo.EDU (Devon E Bowen)
!Originator: bowen@castor.cs.buffalo.edu
!
!In article <4650@anasaz.UUCP>, rusty@anasaz.UUCP (Rusty Carruth) writes:
!|> Guess what won? Yup, I've pretty much decided to not write tapes for
!|> a while.
!
!I always thought you were crazy in the first place. 8-)

Certifiable, I'd say :-)

!The club idea is interesting and I would certainly contribute as a member
!but I have no time to organize it. Anyone else?

I'm leaning toward the idea of organizing it, actually (but considering
how little time I have now for reading news I may not be the BEST choice).

!Devon

!Path: anasaz!asuvax!ukma!wupost!sdd.hp.com!hplabs!hpfcso!hpfcdc!perry
!From: perry@hpfcdc.HP.COM (Perry Scott)
!
!Has anyone ever approached the ARRL ? They're in the publishing
!business, and a version on CDROM could be profitable. Rusty's 70
!hours/year isn't factored into the price. If we paid for the service,
!even at minimum wage, we'd probably find some volunteers.
!
!We could probably cut mailing costs by standardizing on a higher-density
!media, like 8mm, QIC, or DAT. Yes, some people would scream. If you're
!trying to break even, you eliminate the negative-ROI customers first.
!It would make it much easier on the copiers. Most commercial employees
!can convert anything to anything, except maybe punched cards.

Actually, the main problem I had was the amount of human intervention
some media required (like floppies! having to babysit it every 61 seconds
is not my idea of a good time! :-). Shipping size was not such a problem.
If someone was willing to make floppies, more power to them. Or, those
who want floppies could form a pyramid scheme where each person makes 2
copies (ONLY take about an hour or 2 :-) and sends them off to folks who
do the same.... Yeah, too many problems there with that idea.

!I like the idea of a club that buys a new FCC tape when its costs are
!covered. "Costs" though, should include things like labor, media, and
!postage.
!
!Perry Scott / AA0ET

!Path: anasaz!asuvax!ncar!elroy.jpl.nasa.gov!swrinde!cs.utexas.edu!oakhill!nddsun1!waters

!In article <4650@anasaz.UUCP> rusty%anasaz.uucp@asuvax.eas.asu.edu (rusty carruth)
writes:
!
!Now how about some of those who would like to use this service getting
!together and continuing this.

I'm game.

! *Mike Waters AA4MW/7 waters@nddsun1.sps.mot.com *

Ok, how about this. I'll offer to be a focal point (since I'm in
the FAQ it seems, as well as the "elmers" list - which is not a
problem, even if I stop being involved with FCC tapes I'd be happy
to share my experiences/etc with anyone). Shucks, I'll even
work toward getting things organized. Part of getting it organized
will be finding folks to do parts of the work, so I'll need volunteers.

Shall we start a club?

Or, I got mail from someone who is considering doing something commercial
along the lines of what I was doing "sparetime". Shall we just turn the
whole thing over to them? (i.e. give "our" blessing (whatever *that*
means! :-)). (I suppose more information on what they had in mind
would be wise, I'll find his mail and reply as soon as I can)

If we start a club, can we "announce" things about it on internet?
Suggestions for club structure, etc gladly accepted.

On a proceedural note - should we form a mailing list about this?
I would be a VERY bad choice to do it since we tend to be BADLY
connected mail-wise (our immediate upstream tends to be VERY picky
about mail addresses - often bouncing mail if you don't have
".UUCP" after anasaz). So if it goes to a mailing list, someone
else will have to do it.

2108. Re: Does RF Antenna Paint Exist???

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-21 23:25:27 UTC
From: ornitz@kodak.kodak.com
Message-ID: <1991Aug21.232527.28130@kodak.kodak.com>
Source record: 294277

In article <1991Aug21.003001.25284@berlioz.nsc.com> green@berlioz.nsc.com (David Green) asks about painting antennas, how the paint might affect antenna characteristics, and why types of paint would protect best against corrosion, etc.

Almost any paint, if applied thinly, will have little electrical effect on an antenna. The paint, being a dielectric, will tend to increase the electrical length of the antenna slightly, but this effect will be negligible until you reach microwave frequencies and above. Conductive paints and metal loaded paints should be avoided, however. Make sure that you have good electrical contact between sections of your antenna before painting.

Almost any paint will tend to protect a metal antenna from corrosion and oxidation - for a while. You need to make sure that the paint adheres to the metal properly to begin with. This means a CLEAN metal surface; no oil or moisture is allowed on the surface of the metal. It is difficult to get many paints to stick properly to smooth metal, so the surface may have to be roughened (by sandpaper or sand blasting, etc.) and the metal surface may require a primer before the paint is applied. Putting paint down over rust is a waste of effort.

Certain paints tend to hold up better under constant exposure to sunlight and the weather. Acryllic paints tend to hold up well to ultraviolet exposure, and they are inexpensive and commonly available (Krylon, for example). Acryllic paints are also good from an electrical standpoint. I have used clear acryllic coatings for a number of years on antennas, clamps, bolts, and taped coax connections with excellent success. Polyurethane paints hold up well in sunlight too as do many of the newer latex paints. Adhesion may be a problem with latex paints, however.

If you insist on colors, since it was mentioned that the intent was to "hide" the antennas, remember that certain colors fade rapidly like yellows and reds. Paints that use inorganic pigments keep their color well. White paint containing titanium dioxide pigment holds up very well. Paints pigmented with carbon black should also hold up well but should be avoided as somewhat more lossy electrically.

Many plastic insulator parts can be found on commercial antennas. Good parts will be made of materials containing anti-oxidants and ultraviolet inhibitors. Even so, I have found that a generous coating of clear acryllic spray over these parts helps to preserve them. On polyethylene and polypropylene parts, you may have to wait a while for the surface to oxidize slightly before the paint will stick properly.

If you are painting a galvanized tower which is new, you will need to etch the surface of the zinc to get the paint to stick properly. Ask your local painting

contractor how he preps galvanized gutters. If you are trying to salvage a rusty tower - BE CAREFUL. If the tower is structually sound (and you need an expert to verify this), you can sand blast it to remove the rust before painting. There are special inorganic zinc paints that can be used to provide rust protection approaching galvanizing but they are QUITE expensive. They are two part paints with very limited shelf and pot lives; their chemistry is based on ethyl silicate and zinc powder. The so-called cold galvanizing paints such as LPS are clearly inferior to the inorganic zinc. The two part zinc-epoxy systems fall between the two in effectiveness. All of these are suitable for touch-up repairs of galvanized surfaces. A number of companies make the inorganic zinc paints, but you are likely to only buy them on special order from an industrial paint dealer.

2109. Solar Bulletin - Sample Solar Images Available Thru FTP

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-21 23:36:44 UTC
From: oler@hg.uleth.CA
Message-ID: <0094D766.18A0BB40.24780@hg.uleth.ca>
Source record: 294181

/\

SOLAR TERRESTRIAL BULLETIN

21 August, 1991

Availability of Sample Solar Images
via anonymous FTP

/\

AVAILABILITY OF SAMPLE SOLAR IMAGES VIA ANONYMOUS FTP

Six sample solar images which were sent to users of the STD Solar Image Email Service are now available for anonymous FTP from one of the following sites:
- nic.funet.fi <- For European Regions
- vmd.cso.uiuc.edu <- For North American/Austral Asian Regions.

North American and Austral-Asian users, please use vmd.cso.uiuc.edu to obtain the file containing the sample images to help prevent overloading the already heavily used site at nic.funet.fi. European users, please make use of nic.funet.fi instead of vmd.cso.uiuc.edu to help prevent overloading the system at this North American site.

The file to obtain is: SAMPLE.LZH. This single file contains all six sample solar images, archived into a single file using the IBM compatible program "LHA". To extract the sample images, obtain the LHA program through anonymous FTP from a site such as: wuarchive.wustl.edu in the directory: mirrors/msdos/arc-lbr, or use a compatible archiver to extract these images on other systems. Alternatively, have a friend who owns a machine which will handle this archive format extract the images for you.

These sample solar images barely scratch the surface of images which are transmitted on a near-daily basis to those on the Solar Image Email list. For those interested in directly receiving these images (rapidly through email), consult the last paragraph of this bulletin.

To obtain these sample images through anonymous FTP, follow the appropriate instructions below:

FOR USERS OF VMD.CSO.UIUC.EDU, TYPE THE FOLLOWING:

- FTP vmd.cso.uiuc.edu (username: anonymous, password: not required)
- cd PHIL.515
- binary
- get SAMPLE.LZH

- quit

This will transfer the file SAMPLE.LZH to your system from the site at vmd.cso.uiuc.edu. Typing "binary" is critical when FTPing binary files. If you fail to type this command, the file you receive may be garbage.

FOR USERS OF NIC.FUNET.FI, TYPE THE FOLLOWING:

- FTP nic.funet.fi (username: anonymous, password: your address ID)
- cd /pub/dx/solarreports/solarpics
- binary
- get sample.lzh
- quit

This will transfer the file "sample.lzh" to your European system from the site at nic.funet.fi. Typing "binary" is critical when FTPing binary files. If you fail to type this command, the file you receive may be garbage.

Please note that the file SAMPLE.LZH which is stored on nic.funet.fi has been linked to the GIF image directory. The directory "solarpics" on nic.funet.fi is NOT actually a subdirectory of "solarreports". When you change to the "solarpics" directory, you are actually placed in the GIF image directory on nic.funet.fi. Therefore, typing "cd .." will NOT return you to the "solarreports" directory. It will instead return you to the parent GIF directory. To return to the "solarreports" directory, type: "cd /pub/dx/solarreports".

In other words, the directory "solarpics" containing the SAMPLE.LZH file has been logically linked to a directory in the GIF images section of nic.funet.fi. Please be aware of this when attempting to navigate through the solarreports section of nic.funet.fi.

NOTES TO THOSE INTERESTED IN OBTAINING THESE IMAGES DIRECTLY THROUGH EMAIL:

Rapid delivery of solar images is possible through the STD Solar Image Email Service. Persons interested in obtaining these images through this service should send a request for further information to: Oler@Hg.Uleth.CA, or to: COler@Solar.Stanford.Edu.

** End of Bulletin **

2110. Re: Any 23 cm kits available?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-21 23:47:33 UTC
From: tomb@hplsla.HP.COM
Message-ID: <20360034@hplsla.HP.COM>
Source record: 294206

Re: FM transmitter/receiver kits for 23cm band. I believe Hamtronics (if they are still in business--haven't seen their ads lately) have kits for 900MHz. -- Another possibility would be to modify a kit for 440, tripling the transmitter and either adding a converter in front of the receiver or modifying its front end.

]>>unlicensed people on the repeaters around here, but I've also heard the
]>>repeater occupants quite effectively and efficiently run them off.
]
]>I've never heard one of these. Do they just come on and not identify
]>themselves or how do you know they are unlicensed?
We hear them all the time, and catch them occasionally. Normally they
can be found on open autopatches, using the ham radio as a phone. We
found some balloonists using 220 for their chase vehicle communications,
with callsigns == name of balloons. When they persisted after warning,
we arranged for them to be visited, at landing, by an FCC official. That
cost them some bucks ($750 each), so a few weeks later over a dozen of
them joined a ham class, got licensed, and now legitimate.

How do you know it's a non ham? Usually the callsign is no good, or
belongs to someone else and you can figure it out. Sometimes they use
obscenities. Sometimes they use lots of CB lingo.

If they use an autopatch very much, we ALWAYS catch them. A word to
the unwise :-)

2113. Ham radio in Australia

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-22 03:59:32 UTC
From: thayes@romulus.rutgers.edu
Message-ID: <Aug.21.23.59.31.1991.4997@romulus.rutgers.edu>
Source record: 294183

I am going to be traveling to Australia this comming summer and I'd
like to find out about the amateur radio situation there before I go.
I will be applying for a reciprical license before I go so that I can
use my equiptment there.

My questions are:

What is the repeater situation like there? (around Sydney)
Do they require a tone burst like in the UK?
Is PL used frequently?
Most of my operation will be on 2m and above- how active is 440?

Another great concern of mine is the laws regarding scanner type
radios. I have a W2A and it has been modified for extended receive-
will this make it illegal to posess or use?

Do any of these guestions apply- will the reciprical license alow me
to operate VHF and above at all anyway?

What I really mean by these questions is that I have NO clue what to
expect and I want to find out before I go through a lot of paperwork
for nothing.

Any answers to these questions or any other info are apreciated (sp?)

You can reply to me via email or to this group- I read both daily. If
anyone else is interested feel free to mail me and I will give you all
the info I get. If enough people ask I will post to the group. In
about 2 months I will have to go and apply anyway so at that point
I'll post the official answers if anyone wants them.

Thanks ahead of time.

Seems like I have heard old-time hams moan the loss of local shops where one could buy ham equipment. Heard this sort of thing many years ago. Seems that we should be happy that RS is now carrying ham stuff. I haven't noticed any rash of pirates on 10M since RS started selling their 10M rig.

Anyone have a chance to play with the RS 2M HT yet? Looks like it might be a good buy.

2119. Re: 10 meter phone procedures.

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-22 14:04:18 UTC
From: jfs@beno.CSS.GOV
Message-ID: <49924@seismo.CSS.GOV>
Source record: 294190

Last night the novice segment of 10M was wide open from
Virginia to the west and northwest. After 1 1/2 hrs. of dial twiddling,
I still did not have a satisfactory QSO with any one , only three
short, aborted contacts with TN, IL, and KS. Why ? I guess its my
operating procedures, so I'll ask the assembled net elmers for advice.
After listening for about 3 minutes on one frequency, forgetting
to ask if the frequency was in use (Ach what a dummkopf!), and being
politely asked to move on, I eventually found an open frequency, again
listened, this time for about 5 minutes. I must have asked too many times
if the frequency was in use, because a very pleasant gentleman from
Tennessee called to say "no one would mind if you said something".
But as soon as we started our QSO, he got gigged by someone I couldn't
hear for interfering on an ongoing QSO. The same thing happened on the
next two contacts. Every time I listened, called for QRL?, and after the other
guy got gigged, I scanned the beam around its entire azimuth (slowly),
trying to hear the other QSO, nada. I really felt bad for the guy
in Illinois, because he seemed to be apologizing for the next 3 or 4
minutes, I guess he really got his ears pinned back.
So here is my question, what do you do in such conditions,
when you can only be assured of hearing one end of a QSO ?
I was using a 5-element beam and about 60 watts, and was getting
GREAT signal reports. Should I have backed off more in power?
Should I have used the old dipole in the attic to make contacts and
gone to the beam only after starting a QSO? Should I have NOT called
CQ and just listened to QSO's and waited to contact someone who was
finishing up? What I DID do was to slink off of 10M phone back to
40M CW where I know when the frequency is clear. If I can hear them,
they can probably hear me.
Thanks for any advice, I'd hate to start out as a bad
operator, and sorry for such a long note.

From: garyf@wang.com
Message-ID: <baka9y.2dw@wang.com>
Source record: 294194

Hi, I'm not sure if this is the best place for this request, but I couldn't think of a better group to ask.
At some time in the distant past I was told that there exists a database or listing which corelates US Postal ZIP codes to Latitude and Longitude. Basically a listing of the geographic location of all post offices in the U.S..
Does anyone know where I could obtain such a listing (preferable in machine readable form)?

Thanks for any pointers you might respond with.

Gary

You're wondering about indoor antennas. Do you have a lot of steel in your building? My townhouse is mostly wood (albeit with lots of foil-backed insulation in the walls), but I get out pretty well with an indoor antenna. Its= about 100 feet of #14 wire (insulated), tuned with an MFJ Versa Tuner II. I run either 1 watt (Ramsey) or around 40 watts (DX-20). I also use a 20-meter counterpoise, about a 1/2 wavelength piece of wire, run from the ground of the tuner around the baseboard. It loads up well on 40 and 20 (haven't done much on 15 yet). Get lotsa qsos. Also, lotsa TVI, but that's another story.

2123. Re: handheld recommendations?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-22 14:55:59 UTC
From: mcross@hpcvnb.CV.HP.COM
Message-ID: <44810002@hpcvnb.CV.HP.COM>
Source record: 294201

Hi, I just received an ad from PAGE-COM Inc 10935 Alder Circle, Dallas TX 75258 (214)680-9750 or (800)527-1670. The catalog shows Motorola Radius 5.5W channel handhelds for $405, or $475 with private line squelch.

First catalog I've received from this company so I can't tell you anything about their service, etc.

Regards,
Minor Cross KD7YJ hplabs!hpcvn2c!mcross

2124. Re: Re: SWR changes (was "BNC connector power rating?")

>>(< 5 watts) and see if it changes when you increase to 200 watts. This
>>tests more than just the connectors, but it allows you to compare the
>>BNC system to PL-259 or N connectors.

>So what does it mean when the SWR increases with the power? I seem to
>have this problem presently.

In the context of testing BNC connectors, voltage arcing causes the reflected power meter to jump quite high, along with audible pops. Current heating is detected on the power meter as a slow rise in reflected power as the transmitter remains keyed. Presumably, the dummy load and coax can handle both the current and voltage, so you're left with a test of the BNC connectors.

Like the rest of the folks on the net, I think your problem is just the coupling in the SWR meter. I have several meters that exhibit this behavior. In fact, I can get a negative reflected power reading when I send 100 watts into it on the 30 watt range - those pesky 1N34s can have some nonlinear characteristics. When making comparison readings, it helps to keep the forward power constant to compensate for this behavior.

One other factor may be a resistive loss in the antenna system which causes heating and changes the geometry of passive elements. Examples include doorknob caps, coils, and insulators that aren't. One other factor is that the voltage at the end of a dipole can cause local corona (loss) that is not linear with increased power.

Message-ID: <"22-Aug-91.11:30:52.EDT".*.Wayne_A_Lightsey.Roch809_XBS@Xerox.com>
Source record: 294196

Randy writes: "I am having trouble understanding why I cannot switch between the Pakratt program and a terminal program such as Telix. The only way I can get it to work is to do a RESTART or RESET on the PK232. Is there a parameter that the Pakratt program sets in the Pk232? Please e-mail if you can help."

Pakratt, during initialization, places the PK-232 into "HOST" mode - meaning most of the TNC control is done in Pakratt, not in the TNC. Your terminal program is deliberately "dumb" and does not provide the necessary control info when you switch to it, thus the hang up. RESET or RESTART takes the PK-232 out of "HOST" mode and back to dumb terminal mode. There is an option in Pakratt to set the TNC to terminal mode which should then enable you to use your terminal emulator.

For a long,long time, I have wanted to get into ameteur radio. But I never did anything about it. The other day, I was running through the frequencies on my scanner (OUCH! i can feel the flames now) and I came across a 'net' - it apparently was a scheduled event - people on the west coast were talking to people in the Midwest via repeaters. I listened for awhile, getting more and more interested in the hobby.

Enough rambling. Can anyone give me a thumb-nail sketch of what ametuer radio is and how to get started for not a lot of bucks? It's sincerely appreciated.

2128. Need help with Drake TR-3

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-22 16:41:42 UTC
From: heacock@kuhub.cc.ukans.edu
Message-ID: <1991Aug22.114142.32891@kuhub.cc.ukans.edu>
Source record: 294200

First, a big thanks to all those who responded to my request for a copy of a Drake TR-3 manual. I now have manual, schematics, and have already managed one QSO with the rig (my first, CW on 40m)--I knew I could count on you folks. But I still have a few questions:

(1) I noticed that the mic input jack is not a standard .25" phone jack; the manual says it is a .21" jack, and notes that a plug that fits has been supplied (which, of course, I didn't get when I bought the rig). The plug is a three-wire plug. Does anyone out there know if I can still find such a thing, or would I be better off to simply replace the jack in the rig with a regular stereo phone jack?

(2) How do you get a sidetone to listen to when transmitting CW on the TR-3? I used my shortwave receiver with no antenna and the RF gain turned down--I tuned it to the frequency I was transmitting on and managed to do fine for the time being, but I can't help but wonder if there isn't a better way.

(3) On one of the copies of the manual I have, the previous owner made a note next to the "CW Operation" section that says "Note: Push-to-talk switch *must* be used." A similar note appears next to the "AM Operation" section. For my QSO the other night I didn't use the PTT switch, because I don't have a mic for the rig yet. What might this mean? For whatever reason, I am unable to contact the sender of that copy of the manual via e-mail (Alan Brubaker, in case you are reading this). Anyone else have some experience with this rig on CW?

(4) Tuning up: I managed to get the rig going well enough to get a 588 signal report from Arkansas using my indoor random wire antenna (tuned up with an MFJ tuner), but I'm still a little shaky about tuning up. The TR-3 has a XMIT GAIN control, a PLATE control and a LOAD control. I have followed the directions in the manual, in addition to what I can remember of the brief instructions the seller gave to me, but I'm still not sure it's right. For example--the manual says the idling plate current should be about .1 A; mine is never that low--it's more like .25 A. The manual also says the plate current should not go above .45 A when operating, but that only gets me about 50 watts of power (into the MFJ's dummy load), and on 40m I should be getting at least 100 watts (maybe more), right?

(5) On this rig, unless I have misunderstood something, you have to switch the function switch manually from the SSB position to the X-CW position to transmit CW (and back to receive)

I guess this means I don't have QSK capability (assuming I have understood correctly what QSK is). I'm a little concerned about the life expectancy of that switch, in that case. I did notice that on occasion, when switching back from transmitting (the X-CW position) to receiving (the SSB position), sometimes I had to click the switch back and forth several times before I could hear the receiver again. Maybe the switch is going bad, or maybe there is a relay somewhere that's having problems? Could this be a common problem with the TR-3? Suggested work-around or solutions?

Sorry for all the long questions at once--I'm still awfully new at this, but I am learning. I'm betting someone out there has enough experience with this rig to be of great help...thanks in advance.

bruno@hpldsla.sid.hp.com (Bruno Bienenfeild) - actually his log - says:

55 is an Europien MSG. code like we have in ARRL MSG. code book.
It means: "Best wishes to you and your family"

from the log of AA6AD

Thanks to your log for the information. It does seem a bit silly, though - how does the other person even know I have a family? Every time someone sends greetings to my family, I have to stop what I'm doing and call up my parents in England and my brother in Canada and pass on the message - they are getting pretty tired of it, I can tell you.

But then there are plenty of operators out there who seem to know a lot - I only have to send "AA5BT" once for them to come back and say "GE, tnx fer call OM" - I wish I knew how to tell the other op's gender so fast, just from the sounds of their cw. I guess I need to keep practising.

Someone sent me e-mail suggesting that "55", which is used mainly by German operators, was an approximation to "HH" (in cw that makes ~sense), standing for "Heil Hitler" - if that's true, I'm glad I haven't been replying in kind...

>
> Bob Witte / HP Colo Springs / bobw@col.hp.com / KB0CY

True FM deviates the carrier a fixed amount for a fixed amplitude
variation regardless of the frequency content of the modulation.
PM deviates a different amount depending on the amplitude *and*
frequency content of the modulation. Thus PM gives us an automatic
pre-emphasis that is built in to the modulation process. PM modulators
cannot pass DC signaling levels.

Many of the higher speed packet modems depend on the passage of near
DC signals and even with low speed 1200 baud packet the problem of tone
twist can become severe with PM modulators. Tone twist is when one of
the two signaling tones becomes much stronger than the other on reception.

So if the de-emphasis network in the receiver doesn't exactly
match the pre-emphasis generated by the PM modulator, data errors
occur. To avoid these two problems, FM modulation with no pre-emphasis
is preferred for packet. Thus you will see comments about connecting
packet modems directly to the modulator and descriminator of FM rigs.

For voice work, precise audio filters can generate pre-emphasis curves on
transmit and receive that match exactly for FM modulators and descriminators.

The problem is somewhat more difficult with PM modulators and is a function of stage multiplication and other factors. Unfortunately there are several pre-emphasis standards in use. You will hear references to 25 microsecond and 75 microsecond pre-emphasis curves often. These are references to the time constant of the RC audio filters used to generate a given pre-emphasis with an FM modulator. Serious packeteers tend to operate with no pre-emphasis at all to avoid confusion as to which curve is implemented in which radio.

FM modulators allow DC response and allow the user to precisely tailor the frequency response of the system while PM inficts an uncontrolled pre-emphasis on the signal that depends on the frequency content and amplitude of the modulation. This is often undesirable for specialized modulation.

>true that in many receiver designs, insertion of loss at the front-end
>will increase the input-referred 3rd order intercept point (a.k.a. 3IPI),
>but I would hardly call it a feature.
[deletions]

Kenwood's AIP feature is not just insertion of loss, and the July 1991 *QST* review of the TS-850S says this. The review also says (final paragraph, second column, page 44) that selecting AIP in the TS-850S switches in a lower-gain RF amplifier better optimized for low intermodulation and blocking than the transceiver's usual preamp. The test numbers shown in Table 1 of that article show that the TS-850S's AIP circuitry does exactly what its name implies: It increases the TS-850S receiver's third-order intercept point--in our test -sample transceiver, by 8.5 dBm at 3.5 MHz and 8 dBm at 14 MHz. Under some conditions, this may improve reception marred by strong-signal overload.

Source record: 294216

In rec.radio.amateur.misc, awinterb@diana.cair.du.edu (Art Winterbauer) writes:

>As an aside, could someone explain what the difference is between
>PM and FM?

If you think about it, it is impossible to change the phase of a
sine-wave signal without at least momentarily changing the frequency.
Let's say you have a 1 Hz sine wave. Over a 10 second period, you
would like to retard the phase by 360 degrees (1 cycle). The way to
do this is to change the frequency to .9 Hz for the 10-second period.
At the end of 10 seconds, you will be one cycle "behind."

If you want to change the phase over a shorter period (say 5 seconds),
you have to change the frequency by twice as much (.8 Hz). In general,
the faster you change the phase (that is, the higher the modulation
frequency), the greater will be the frequency deviation. So:

In a phase-modulated signal, the higher the modulation frequency,
the greater the frequency deviation.

You can get the same effect by using a FREQUENCY modulator and
including a "6 dB per octave" preemphasis network in the audio amplifier
that causes high modulation frequencies to have greater deviation.

Similarly, you can generate FM using a phase modulator by including
a 6 dB per octave DE-emphasis network. The only difference between
FM and PM transmitters is the frequency response of the audio.

"FM" transceivers today most closely resemble a PM audio characteristic,
despite the fact that most rigs actually use some form of FM modulator.
In the old, old days, early "FM" transmitters actually used a device
called a reactance modulator, which is a type of phase modulator.
The undistorted modulation range was only around +/- 20 degrees or so
which corresponds to around 1 kHz peak deviation (if I did my math
right). You had to use a low-frequency oscillator/modulator and
multiply many times to get the required 10-15 kHz deviation. They
also tended to run the modulator "balls to the wall" which gave
phase modulation a reputation for having audio distortion.

As an aside, could someone explain what the difference is between PM and FM? I couldn't follow the arguments I've read in the literature (including the ARRL license manuals). The concept seems just barely out of reach for me. Please post your answer, as there are probably a few of us out here who can't quite grasp the idea.

One way it was explained to me that helpd to see a big difference was this: PM essentially differentiates the signal. For audio this is usually fine. You transmit a sine way and the derivative of this that the reciever generates is still a sine wave (well, a cosine if you want to be technical).

When you put a DC signal into the transmitter you get nothing out of the reciever since the derivative of a constant is zero.

This is why the g3ruh modem doesn't work well with PM transmitter. In reality, however, you can almost pretend the fast digital pulses are really AC and can get some some results anyway.

True frequency modulation can produce a DC output at the proper reciever. Note that most audio sections in radios will filter this out.

I may have done more harm than good here but that is the way this CS person understands it. I quit taking math after CALC-II.

>
>My questions are:
>
>What is the repeater situation like there? (around Sydney)

There is a good spread of repeaters in Sydney.
VK2RWI is in Dural, north of the City (147.00 TX 146.400 RX)
It along with the repeater in Heathcote VK2RLE (South of the City) 146.8/146.2
were the main ones when I lived in Sydney. (I was back in March and
things hadn't changed much).
These two repeaters have excellent coverage. (I could hit the Heathcote
machine from almost anywhere in Sydney). There's a WICEN (Wireless
Institute Civil Emergency Network) repeater in the Eastern suburbs
and several serving the Blue mountains west of the city. None (as far
as I know have either Tone burst or PL access). No such thing as a
private repeater in OZ!
Activity on 440 is much like the US. (cf VHF)

>Another great concern of mine is the laws regarding scanner type
>radios. I have a W2A and it has been modified for extended receive-
>will this make it illegal to posess or use?

Unless things have changed, the Radio communications act (1983),
made all receivers legal. So your scanner is OK. (just don't bring
a colour TV into the country! The customs people will hit you with
100 percent duty)

>
>Do any of these guestions apply- will the reciprical license alow me
>to operate VHF and above at all anyway?
>

I'm not sure how the reciprical licence works with Australia but
when I operated under a reciprical licence in the US (W3/VK2BEA)
my privilages were the intersection of the US extra and my Australian
privilages. (i.e. Australian rules NOT to exceed extra class privilages).

Three and a half licences in OZ:
Full Call. ----- All amateur privilages

Limited Call. - All amateur privilages above 6 metres (no code)
Novice Call. - some HF and 144 MHz
Novice/Limited - sum of last two!

I can post a list of repeaters if anyone is interested. (I've got
a VK call book at home)

2140. Dayton 92 Dates

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-22 21:45:34 UTC
From: cjackso@uswnvg.UUCP
Message-ID: <1119@uswnvg.UUCP>
Source record: 294212

Can someone send me the dates for the Dayton Hamfest for 1992? I may
have a chance to be back that way, but need to firm up the dates ASAP.

73!

2141. QSL Buros: Basic Questions

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-22 22:04:36 UTC
From: awinterb@diana.cair.du.edu
Message-ID: <1991Aug22.220436.7755@mercury.cair.du.edu>
Source record: 294219

It's been 25 years since I've used QSL buros, and now I can't remember how it's done.

1. How would I send a card to a DX station's QSL buro if I know the ham's callbook address and the buro's address: will the DX ham have given the buro manager the postage already, or should I include some?

2. If I'm not registered with a buro (and not likely to be, as sparse as my DX contacts are), should I send along some IRCs for a reply? If so, how many (I'm thinking of USSR and Australia, here) and where the heck do you buy the things?

2142. Re: True FM vs. Phase Modulation ?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-22 22:56:11 UTC
From: tomb@hplsla.HP.COM
Message-ID: <20360035@hplsla.HP.COM>
Source record: 294130

awinterb@diana.cair.du.edu (Art Winterbauer) writes:

>As an aside, could someone explain what the difference is between
>PM and FM? I couldn't follow the arguments I've read in the
>literature (including the ARRL license manuals).

For a sine wave audio signal, they produce identical results. In fact,
if you tune in a PM signal that was generated with an audio channel
that has flat frequency response, and then tune in an FM signal with the
same qualification, the PM signal will seem to have increased
high frequency audio and decreased low frequency audio compared with
the FM signal. You can correct that by using an appropriately
different frequency-response-shaping filter on each transmitter.
Then from audio in to audio out you could no longer tell the
difference.

I'll try for a simple explanation of this (Bear with me here, there's
not very much math): I do have to assume you understand that

v(t) = V * sin(wt+ p)

represents a signal with amplitude V (peak) and frequency= 2*pi*w,
and that p represents a phase angle that doesn't matter much if it's
constant.

You can modulate V, w, or p. Modulating V is amplitude modulation.
Modulating w is frequency modulation. Modulating p is phase modulation.

Assume you can modulate with a signal that goes all the way down to DC.
Then if you put DC into an FM transmitter "audio" channel, it actually
changes the frequency, say from 146.000000MHz up to 146.001000MHz for
some particular voltage. If you put that same DC signal into a PM
transmitter "audio" channel, it would change the phase, but if you
started looking at the signal after the DC was applied, you wouldn't
see any change, and the frequency would be 146.000000MHz. But what if
you put in a voltage RAMP instead of a voltage STEP. Then the phase
would be increasing continually. In fact, you could note that

p = Vramp * constant

but Vramp = constant2 * t , kinda the definition of a ramp, and that
leads to

p = c * t

and if you put that back in the original formula above,

v(t) = V * sin(wt + ct) = V * sin((w+c)*t)

In other words, you have shifted the frequency!

You can get a ramp from a constant DC by putting it through an integrator. In fact, if you had done that original experiment with audio on an FM transmitter and a PM transmitter but modified the PM transmitter by putting an integrator in the audio path, then the two would sound just the same (assuming you had adjusted the levels, or deviation, the same).

Of course there are several practical matters, like you wouldn't be able to let a ramp go on forever because that would imply an ever-increasing voltage, and also there's "pre-emphasis" on (most) transmitted FM, which above some frequency looks about the same as what the PM does naturally, so you don't actually need an ideal integrator...

Most detectors for FM/PM are true FM detectors (including things like quadrature detectors, ratio detectors, and discriminators), but transmitters can be done either way. In a typical crystal-controlled transmitter, modulation applied to a varicap across the crystal actually changes the frequency (FM), and to a varicap or equivalent across any later tank circuit causes phase changes, so is PM.

Hope this helps...

jfs@beno.CSS.GOV (Jim Scheimer) writes:

> Last night the novice segment of 10M was wide open from

(munch)

>minutes, I guess he really got his ears pinned back.

Well, here is where I start to climb the Soapbox.

You were correct in listening before transmitting. Probably more so than
I would have been. But this is the inherent problem with 10 meters...
you can't hear both ends of the contact. And what's clear for you will
PROBABLY NOT be for the other guy. In this case, the answering party might
want to query if the freq is in use, and/or have the caller move up/down to
a clear spot. Just random thoughts.

> So here is my question, what do you do in such conditions,
>when you can only be assured of hearing one end of a QSO ?

See above.

>I was using a 5-element beam and about 60 watts, and was getting
>GREAT signal reports. Should I have backed off more in power?

I wouldn't have... 60 should be enough (6 watts, if the band is open
will do amazing things...)

>Should I have used the old dipole in the attic to make contacts and
>gone to the beam only after starting a QSO? Should I have NOT called
>CQ and just listened to QSO's and waited to contact someone who was
>finishing up? What I DID do was to slink off of 10M phone back to

Use the beam, sweep around AFTER you have parked on a freq, then you
can do one of 2 things: (1) if you hear a QSO, you can wait until they've
signed (or if it looks like they're chatting about an interesting subject,
you could always ask to break in & make it a 3-(or whatever)-way...
OR, (2) if you DON'T hear anyone, put out a QRL (voice version), and if
the freq's clear, put out the CQ.

NEVER NEVER NEVER let the bullies get you down. I realize that you're a
newer Ham, and I congratulate you for getting your ticket. BUT, there are
a LOT of Idiots (that I'm probably gonna have to buy a New Flame Suit :-))
out there that Have No Clue. Unfortunately, there's no LID Filter on a radio,
except for the power switch, although you could always QSY....

Enjoy the hobby, and if some Pseudo Big Gun tries to give you grief, just
extend your middle finger (upright) at the general direction of the radio,

smile, and go on to the next contact. No one has all the answers, and having some Frequency Cop gig you just ain't worth the ulcers.

BACKGROUND: I am an Extra (got the code first, then the theory), and have been a ham since 1979. I run ~100w either mobile or portable, since I am in an apartment. I have been on 10 meter SSB/CW/FM since Day 1 (as well as Net Control for traffic nets on 20 & 40) of my licence acquisition. I also run 6 meter QRP, as well as 2/440 FM and packet. I have no time for those (hams or otherwise) who won't accept input on an issue. I have plenty of time to constructively discuss an issue. I also have a sense of humor, and don't let Amateur Radio run my life. Work & the XYL does enough of that... :-)

Collins used this same jack for their microphones. I see them listed
in My Newark catalog (P/N 39F667 $2.08 in single quantity. Min. order
$25.) Dunno if Shadio Rack has 'em, but I bet your local wholesale
electronics distributor can get them.

>(4) Tuning up: ... I have followed the directions
> in the manual, in addition to what I can remember of the
> brief instructions the seller gave to me, but I'm still not
> sure it's right. For example--the manual says the idling plate
> current should be about .1 A; mine is never that low--it's more
> like .25 A.

"Idling" plate current means with the rig in transmit mode, but with
the key up (no signal being transmitted). If your platge current is
too high in this mode, you need to adjust the final amplifier grid bias.
This is a control on the (external) AC-3 power supply.

> The manual also says the plate current should not
> go above .45 A when operating, but that only gets me about 50
> watts of power (into the MFJ's dummy load), and on 40m I should
> be getting at least 100 watts (maybe more), right?

You may have the loading control turned up too far. Or if the loading
is already turned full CCW, you may have too high an SWR. I always
just adjust loading and tuning for max power output. If this
results in excessive plate current with the loading control max CCW,
then you need an antenna tuner (or better-tuned antenna.)

>(5) On this rig, unless I have misunderstood something, you have to
> switch the function switch manually from the SSB position
> to the X-CW position to transmit CW (and back to receive)
> I guess this means I don't have QSK capability (assuming I have
> understood correctly what QSK is).

Correct. (The TR-3 is, shall we say, a trifle "inconvenient" on CW :=)

> I'm a little concerned about the life expectancy of that switch,
> in that case... Suggested work-around or solutions?

A valid concern. The TR-3 makes a great phone rig, but (IMHO) is suitable only for occasional casual use on CW. A much better CW rig is the Drake "4-line" R4, R4A, R4B or R4C receiver / T4X, T4XB or T4XC transmitter / AC-4 Power supply. You can buy a set for $200 to $500+ depending on model and condition.

>As an aside, could someone explain what the difference is between
>PM and FM?

Well, fools rush in, but here is my attempt anyway.

From the RECIEVING end there is no difference, provided that the transmitter is adjusted to compensate for the differences.

At the TRANSMITTER it boils down to a different "modulation index" because the two are achieved in different ways. Basically that means that the deviation for a given modulation frequency is different. This can (and usually is) compensated for by changin the frequency response of the modulation audio.

I forget which has the more highs FM or PM.

FM is achieved by actually changing the frquency of the transmitter oscillator. With a PLL this can be achieved by modulating the loop voltage, with a crystal oscillator by changing the crytstal loading with avoltage variable capacitor (back biased diode).

PM can be achieved by changing the tuning of an amplifier stage or of the coupling between stages. This results in some amplitude modulation which is removed by following stages.

PM is much easier to use and adjust since it can be applied to several stages if required. Almost all modern equipment uses PM.

Hopefully I haven't missed anything or reversed anything! I'm sure someone on the net will let me know if I have!

In article <1991Aug22.220436.7755@mercury.cair.du.edu> awinterb@diana.cair.du.edu (Art Winterbauer) writes:

These probably should be in the FAQs!

>1. How would I send a card to a DX station's QSL buro if I know
> the ham's callbook address and the buro's address: will the DX
> ham have given the buro manager the postage already, or should
> I include some?

If you are going to send a card via the buro, use the ARRL outgoing service! It costs $1 per 100 cards (or so). It is a waste of time and money to send a card to a buro in a DX location if you the DX station's address, the postage is the same to send it directly there!

It is generally assumed that cards through the buro are CHEAP but SLOW. It is not unusual to take a year round trip, and may take three or four years!

>2. If I'm not registered with a buro (and not likely to be, as
> sparse as my DX contacts are), should I send along some IRCs
> for a reply? If so, how many (I'm thinking of USSR and
> Australia, here) and where the heck do you buy the things?

First I STRONGLY suggest that you register with the incoming buro.

ALL it takes is a 5x7 SASE with your call on the upper left corner of the envelope. See QST for the address of your buro. You will use the "0" buro no matter where you live BTW.

The U.S. incoming buro is ALL volunteer and the biggest problem they have is unclaimed cards!

You can find out the number of IRCs to send in the Callbook. Send enough for air mail BTW. Alternatively send a $1 bill ("green stamp"). Be careful with "green stamps" though, in some cxoutries they are illegal. A few years ago a Soviet ham spent several months in jail because his address gout out and people all over the world sent him money! Obviously a subversive of some sort - right?

This was pre-glasnost, but there are still countries that are as paranoid.

THe best place to buy IRCs is from a QSL manager of a DXpedition or rare country, typically they sell 100 (or so) at a time for 1/2 the post office price. You CAN also buy them at any post office (anywhere in the postal union, not just the US!), but they cost almost $1 each. THe ham at the other end only sees about $.30 of this, so a "green stamp" is

definitly better.

Get to know some local DXers, you will find they have a wealth of good information.

Frequency Modulation:
True FM has the "timebase changed". This means that the frequency
actually changes from time to time, centered around a base
frequency.

Phase Modulation:
True PM has a "fixed timebase". This means that the time between
the start of one cycle to the start of the next cycle crosses
zero at the same time. Data/Voice is encoded on a PM signal
by changing the shape of the waveform without changing the timebase.

I imaging that some signals may have both characteristics.

//
Department of Transport and Communications.

Statement concerning the issue of licences authorising overseas
amateurs to operate amateur radio stations in Australia.
//

1. The Department will consider applications for the issue of Australian
amateur station licences from overseas amateur licensees,
identified below, provided their qualifications are deemed acceptable
for the purpose:

(a) Amateur licensees from countries with which the Australian
Administration has a reciprocal licencing arrangement
(Canada, Denmark, France, India, Israel, Japan, Malaysia, New Zealand,
Papua New Guinea, Singapore, Solomon Islands, Switzerland,
United Kingdom, United States of America and West Germany) and

2. Applications should be lodged with the Communications Manager,
Communications Operations Division of the Department of Transport and
Communications in the capital city of the State in which it is
first intended to establish the amateur radio station.
Lodging of applications IN PERSON is preferable as it will facilitate
the sighting of original documents, referred to in 3 below, and the
immediate issue of a licence. A list of Department addresses in
included in the foot of this statement. Although mail applications
will be accepted, it should be noted that to allow the issue and
dispatch of a licence to a visitor's overseas address,
they must reach the office of the appropriate Communications Manager,
Communications Operations Division at least THREE MONTHS prior to the
visitor's arrival in Australia.

3. An Australian amateur station licence, comparable to the class
of overseas licence held, may be issued upon submission of the
following:

(a) completed applications (Form DOC57);

(b) the applicant's licence or a copy of the licence, certified to be true and correct by a person authorised to administer oaths in the country concerned;

(c) proof that the licence is current;

(d) proof, such as a visa, that the authorised visit will not exceed 12 months; and

(e) a licence fee of $A32. This fee is valid up to 30/11/90, after which date a new fee schedule will come into effect. (Cheques or money orders should be made payable to the Receiver of Public Monies).

4. AN AUSTRALIAN AMATEUR STATION LICENCE ISSUED TO AN OVERSEAS AMATEUR MAY NOT BE USED TO SEEK THE ISSUE OF A RECIPROCAL LICENCE IN ANOTHER COUNTRY.

5. Any person who has been granted an Australian amateur station licence must at all times comply strictly with the conditions pertaining to the operation of the Australian amateur service, which are contained in the departmental brochures DOC70, 71 and 72. Copies of these brochures are available from departmental offices.

6. Overseas amateur licensees who regularly visit Australia for periods not exceeding 12 months, eg: airline or merchant navy personnel, may be issued with an annually renewable licence.

7. Amateur licensees from countries with which a reciprocal arrangement does not exist, whose authorised stay will exceed 12 months, or who intend to become permanent residents in Australia, are required to qualify for the issue of an Australian licence by examination.

> would I be better off to simply replace the jack in the rig
> with a regular stereo phone jack?

This is a standard aircraft plug. Check with aircraft electronics suppliers or a big distributor like Allied or Newark. Locally in Atlanta, these plugs are available from Ack Radio Supply.

>(2) How do you get a sidetone to listen to when transmitting CW on
> the TR-3? I used my shortwave receiver with no antenna and

I always just listened to the click clack of the key.

>(3) On one of the copies of the manual I have, the previous owner
> made a note next to the "CW Operation" section that says "Note:
> Push-to-talk switch *must* be used." A similar note appears
> next to the "AM Operation" section. For my QSO the other night

> am unable to contact the sender of that copy of the manual via
> e-mail (Alan Brubaker, in case you are reading this). Anyone
> else have some experience with this rig on CW?

I think that the PTT switch works the TR relay. On the T4 you could use the VOX circuit to give semi-break in operation. I don't remember if the VOX works that way on the TR3. If you aren't activating the TR relay, that could explain your low output power and your questions about tuning.

>(4) Tuning up: I managed to get the rig going well enough to get
> a 588 signal report from Arkansas using my indoor random wire
> antenna (tuned up with an MFJ tuner), but I'm still a little

> shaky about tuning up. The TR-3 has a XMIT GAIN control, a
> PLATE control and a LOAD control. I have followed the directions

> current should be about .1 A; mine is never that low--it's more
> like .25 A. The manual also says the plate current should not
> go above .45 A when operating, but that only gets me about 50
> watts of power (into the MFJ's dummy load), and on 40m I should
> be getting at least 100 watts (maybe more), right?

There's a bias control on the back that allows you to set the idling current. The power rating of this transmitter, and all others of it's vintage, is plate *input* power, not output power. It should have a plate input power of 300-360 watts at .45 amp and an output power around 180-200 watts. Something is not right. Check the plate voltage, it should be 750-800 volts. Make sure the TR relay is working.

The tuneup procedure involves putting the mode switch in the X position, setting the LOAD control to minimum, keying the transmitter, tuning the PLATE control for a dip in plate current, advancing the LOAD control, redipping the PLATE back and forth to the desired plate current at dip. You may advance the drive control as necessary to get the desired drive. If I remember correctly, you can press in on the PLATE control and the meter switches to relative output. You can tune for a peak reading here. When this transmitter is properly loaded the dip is very shallow, it operates best when very heavily loaded so using the output indicator to show final tuneup is a useful aid to proper tuning. Keep key down very short, no more than 10 seconds at a time. The finals in this rig don't like long continous carrier, especially if you are off resonance.

>(5) On this rig, unless I have misunderstood something, you have to
> switch the function switch manually from the SSB position
> to the X-CW position to transmit CW (and back to receive)
> I guess this means I don't have QSK capability (assuming I have
> understood correctly what QSK is). I'm a little concerned
> about the life expectancy of that switch, in that case. I did

> (the X-CW position) to receiving (the SSB position), sometimes
> I had to click the switch back and forth several times before
> I could hear the receiver again. Maybe the switch is going bad,
> or maybe there is a relay somewhere that's having problems?
> Could this be a common problem with the TR-3? Suggested work-
> around or solutions?

It's been a long time, but this is certainly wrong. You put the switch in the X-CW position to tune up or run CW. You shouldn't have to switch back to SSB to receive. Old Drakes do have a problem with switch contacts oxidizing. You should carefully clean the contacts of this switch. That may be why it won't receive in this position. There is a TR relay near the rear of the radio. It should operate when you go from receive to

transmit with the PTT switch. If it isn't, something is badly wrong.

I had a TR4 many years ago and a pair of Drake Twins up until about 5 years ago so my memory of how they operate is a little fuzzy. I hope some of this has helped.

Source record: 294227

Contact the NBS in Boulder, CO. You can call WATS info (800 555 1212) for the number of the Federal Information Service which will then give you the NBS number.

NBS (they have a new name now which I can't remember) operates the radio stations WWV in Boulder on 2.5, 5, 10, 15 and 20 MHz and WWVH in Hawaii on all but the 2.5 MHz frequency, I think.

HEATH (Benton Harbor, MI) has a WWV-sync'ed clock with a digital interface that is probably the best bet for what you want. Any general coverage receiver will receive the signals.

Good luck,
Wayne, KB6CSP

Not true! Rep of Ireland has NOT signed up yet. Part of the problem is that hams have a radio experimenter licence not an amateur licence.

>use my equiptment there.
I was in OZ last year and succeeded in getting my recip license in about 30 minutes at the D.O.C. (I think) office in Sydney. I even made the terrible mistake of not taking my original license. They examined the photocopy that I had and somehow checked out the callsign as legit. I can dig up more info if you need it.

If you are taking an HT, you might try and figure out how to charge the batteries. You could take your US charger and one of the 'foreign' power adapters. I ended up buying a Tandy (yes, Radio Shack lives in OZ) AC adapter while I was there. It seemed to work OK.
>
>Do any of these guestions apply- will the reciprical license alow me
>to operate VHF and above at all anyway?
Yes, you can use 2 meters.

About the only down side is the license was a bit pricey. $30 or $40 I believe (no, I don't remember if it was US$ or Aus$) and the license is only good for one year. So for a several week trip to OZ, its kind of expensive. But I did it anyway.

And, of course, the other problem is the language barrier. :-)

2157. FM vs PM ?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-23 15:42:06 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <23.Aug.91.16
Source record: 294137

FM vs PM; well my understanding is that with FM the frequency shift is related to the absolute value of the modulating signal, whereas PM relates deviation to the rate of change of the modulating signal. So if you feed a DC voltage into the modulator, a true FM modulator would result in the frequency changing to its new value (and staying there), whilst a PM modulator would produce a brief deviation (as the DC voltage charged up the capacitors/varicaps inside the modulator) but the output frequency would then revert to its initial frequency once this charging-up had completed. You cannot represent true DC levels with PM.
I will not bore you to tears with a description of the problems of DC components on signals - any of the standard references to data encoding protocols will cover this.

2158. Discone Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-23 16:01:23 UTC
From: sdkuo@argo.acs.oakland.edu
Message-ID: <9275@vela.acs.oakland.edu>
Source record: 294128

Having both a scanner and a 2 meter HT, I want to mount an antenna on
my roof. What I'm currently thinking about is getting a discone, since
I mainly scan at home (and use the HT mobile), but I would still want
to transmit using the discone. Most discones say that they can transmit
on amateur bands with a VSWR of 1.5:1.
My question is what kind of gain can I expect (if any) using the discone
to transmit (say at 2 meters). Does anyone have a discone and could
comment on its performence. I thinking about using 9913 coax cable
since I want low loss at VHF and UHF, any comments on coax cable?

thanks for all info,

Department of Transport and Communications.

Statement concerning the issue of licences authorising overseas
amateurs to operate amateur radio stations in Australia.

1. The Department will consider applications for the issue of Australian
amateur station licences from overseas amateur licensees,
identified below, provided their qualifications are deemed acceptable
for the purpose:

(a) Amateur licensees from countries with which the Australian
Administration has a reciprocal licencing arrangement
(Canada, Denmark, France, India, Israel, Japan, Malaysia, New Zealand,
Papua New Guinea, Singapore, Solomon Islands, Switzerland,
United Kingdom, United States of America and West Germany) and

2. Applications should be lodged with the Communications Manager,
Communications Operations Division of the Department of Transport and
Communications in the capital city of the State in which it is
first intended to establish the amateur radio station.
Lodging of applications IN PERSON is preferable as it will facilitate
the sighting of original documents, referred to in 3 below, and the
immediate issue of a licence. A list of Department addresses in
included in the foot of this statement. Although mail applications
will be accepted, it should be noted that to allow the issue and
dispatch of a licence to a visitor's overseas address,
they must reach the office of the appropriate Communications Manager,
Communications Operations Division at least THREE MONTHS prior to the
visitor's arrival in Australia.

3. An Australian amateur station licence, comparable to the class of overseas licence held, may be issued upon submission of the following:

(a) completed applications (Form DOC57);

(b) the applicant's licence or a copy of the licence, certified to be true and correct by a person authorised to administer oaths in the country concerned;

(c) proof that the licence is current;

(d) proof, such as a visa, that the authorised visit will not exceed 12 months; and

(e) a licence fee of $A32. This fee is valid up to 30/11/90, after which date a new fee schedule will come into effect. (Cheques or money orders should be made payable to the Receiver of Public Monies).

4. AN AUSTRALIAN AMATEUR STATION LICENCE ISSUED TO AN OVERSEAS AMATEUR MAY NOT BE USED TO SEEK THE ISSUE OF A RECIPROCAL LICENCE IN ANOTHER COUNTRY.

5. Any person who has been granted an Australian amateur station licence must at all times comply strictly with the conditions pertaining to the operation of the Australian amateur service, which are contained in the departmental brochures DOC70, 71 and 72. Copies of these brochures are available from departmental offices.

6. Overseas amateur licensees who regularly visit Australia for periods not exceeding 12 months, eg: airline or merchant navy personnel, may be issued with an annually renewable licence.

7. Amateur licensees from countries with which a reciprocal arrangement does not exist, whose authorised stay will exceed 12 months, or who intend to become permanent residents in Australia, are required to qualify for the issue of an Australian licence by examination.

>
>Marc Wiz
>WA6HBR

I have fond memories of operating on those two machines in the early 80's.
Bootlegging, jamming, bizzar discussions, personal attacks, arguments are
among the things I like best about radio. On a good night, it takes
2-3 Kw ERP or a properly located remote base to get into the 147.435 machine.
I believe this type of competetiveness is healthy for AR and has done
wonders for the advancement of VHF amplifier and remote base technology
in the Los Angeles area.

I also enjoyed the operating style in the "war zone" 7.250-7.260 Mhz.
There you could (and still can) have a conversation about anything.
Everyone uses VOX (no "push-to-talk" allowed) and the conversation goes
back and forth very quickly just as if your talking with a group of people
in a room. Call signs are used sparingly.

In addition, I believe that operators accustomed to dealing with interference,
congestion, and jamming are better prepared for disaster operations.

Bringing jamming technology into the 90's,

Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc

Here's the text of Gorbachev's remark during his first press conference about listening to shortwave radio while being held captive. The source is the Associated Press, via a local newspaper. Makes you feel like a 'smart guy', eh?

-- begin quote --

Remark from Audience: How did you get information from dacha?

Gorbachev: Huh? No, everything was down, but we found some type of old receivers in the maintenance rooms, and we fixed the antennae - there were some smart guys who know something about this - and we began to get whatever we could from there. We got the BBC best of all (laughter and applause). The BBC came in best of all. (laughter) (Radio) Liberty, and then the Voice of America came on.

Please pardon this post if it's totally inappropriate, but, does anyone have any info on the use of video transmittors, FCC regs, setting up a home television station, economical means for video broadcasting, etc? I saw a spot on one of the morning shows about people in rural areas who were broadcasting community video, sounded real interesting, but, I could never find out how to go about setting up a personal studio.

Thanks,

Jeff

waters@nddsun1.sps.mot.com (Mike Waters) says:

(lots of excellent advice deleted)

>If you are going to send a card via the buro, use the ARRL outgoing
>service! It costs $1 per 100 cards (or so).

Specifically, $2 per pound.

>First I STRONGLY suggest that you register with the incoming buro.
>All it takes is a 5x7 SASE with your call on the upper left corner of
>the envelope. See QST for the address of your buro. You will use the "0"
>buro no matter where you live BTW.

Seconded. If you *ever* make non-U.S. contacts, you should keep envelopes at the bureau. If you don't want the cards, tell the other station at the time that you do not send or reply to QSLs. On the few occasions people tell me that over the air, I appreciate knowing it, and don't send a card via the bureau. I think less of the people who say "QSL sure via buro" and then don't.

The latest QST has directions for using the incoming bureau, bottom half of page 64. Roughly every second issue has directions for using the incoming or outgoing bureaus. They are among the best bargains around (OK, so you get lots of E. European cards with pictures of tractors or wrenches on them, you can always give them to your kids - after you have replied to the cards, of course).

By the way, the "5" area bureau is in the process of moving from Oklahoma City to Midland, Texas. This change will take place over 6 months or so, but if you are about to send envelopes for 5 area cards, you might want to wait a little until the details are announced.

>to transmit (say at 2 meters). Does anyone have a discone and could
>comment on its performence. I thinking about using 9913 coax cable
>since I want low loss at VHF and UHF, any comments on coax cable?

I've got a discone in my attic with a 9913 feed, and it works well! I can hit 2M repeaters within about a 25-mile radius, and I'm not particularly well sited. I also wanted to do things on a number of bands without putting up several antennas, and this seems a good compromise to me. I'm told that a discone has the same 'gain' as a dipole, either 0dBd or 6(?)dBi, depending on how you reference it. The basic discone is supposed to be a pretty good match between 130 and 1300 MHz, though many of them have a whip on top that does a mediocre job on some of the low bands (some of them are spec'ed down to 25 MHz...). It'll work at least as well as a quarter-wave ground-plane in the car.

2169. ARRL VEC Exam FAQs

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-23 19:41:01 UTC
From: bjahnke%arrlhq.UUCP@uhasun.hartford.edu
Message-ID: <220@arrlhq.UUCP>
Source record: 294166

AMATEUR RADIO EXAMINATION OPPORTUNITIES

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information. Email may be sent to the ARRL/VEC at:

bjahnke%arrlhq.UUCP@uhasun.hartford.edu

You should include your postal address (the slow kind) in case we need to send you non-electronic material in answer to your question.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team are aware that you be attending the test session.

STILL NEED TO PREPARE FOR YOUR EXAM?

If you would like information on how to become licensed; or how to locate Amateur Radio clubs, instructors, licensing classes and/or Novice examiners in your area; please contact the ARRL Educational Activities Department (EAD) at 203-666-1541 x219. The EAD can also provide information on recommended study materials.

AFTER THE EXAM - HOW LONG WILL IT BE BEFORE MY LICENSE ARRIVES?

If you've recently passed your initial examination for an Amateur Radio license, or if you've just upgraded, please accept our warmest congratulations! Now that you've passed the test, receiving your license in the mail is the next step.
Since the FCCs current license processing time is at about seven weeks, and since there can be additional time required within the volunteer examiner system of two weeks or so allowing your VE Team and VEC (if for Technician class or higher) time to process your application, your license might not arrive for up to eight to ten weeks.
To keep your wait for that new license or upgrade as short as possible, we are taking the following steps to give you the fastest possible service.

We have begun providing our VE Teams with express OVERNIGHT mailers for the return of applications from ARRL/VEC exam sessions to us at the VEC--and we at the VEC have begun sending our daily packages to the FCCs Licensing Facility via an express OVERNIGHT service.
We are also encouraging our VEs, and imposing the same emphasis upon ourselves, to process examination packages as quickly as possible to expedite your license.
Having implemented the above procedures, the ARRL/VEC wants your wait for your new license to be as short as possible.
If you have any other suggestions about the program, or services we provide, please feel free to contact us.

THINGS TO BRING TO THE EXAMINATION

Be prepared to bring the following items with you to VEC examinations: Your original current FCC-issued Amateur Radio license (and a copy of it)--if you are licensed; Any original Written or Code Element credit documents (CSCEs) which are currently valid; Two forms of identification (e.g., a photo-ID or drivers license and another item indicating your current name and address); A calculator (if necessary); A pen and two pencils; and, the applicable examination test fee ($5.25 for 1991 ARRL/VEC Test Sessions).

TECHNICIAN CLASS GRANDFATHER CREDIT

If you hold a Technician class license which was issued prior to 3/21/87, you are not required to take the Element 3B (General class written) examination if you can provide a copy of your FCC-license dated before that date. If your licensed has since been renewed, and if you don't have a copy of the pre-3/21/87 license, you must seek a verification letter from the FCC. To do so, write to FCC, 1270 Fairfield Rd, Gettysburg PA 17325-7245 and request a Form 1010-B Verification Letter verifying that you were licensed as a Technician class prior to 3/21/87. After you receive that form from the FCC, bring it to the test session with you in order to claim your deserved credit.

LOST LICENSES

If you have lost your license, VECs are not permitted to submit any upgrades to the FCC without a copy of your current license attached to the 610 form. In order to expedite your upgrade, you must write the FCC and request a replacement license. Since that will take six weeks or more, we recommend that you also request a Form 1010-B verification letter from the FCC which will arrive in a couple of weeks--and is legally binding license document.

You may use that form as a license until your Form-660 license arrives. The original and a copy of Form 1010-B must be brought to the test session verifying that you are currently licensed--the copy of which will be attached to your upgrade application (in lieu of an actual Form-660 license copy). To request the Form 1010-B Verification Letter, write to: FCC, 1270 Fairfield Rd, Gettysburg PA 17325-7245; indicating that you lost your license and that you are requesting that a replacement license be issued to you--also be sure to request that they send you a Form 1010-B Verification Letter verifying that you are licensed.

ACCOMMODATIONS FOR THE HANDICAPPED OR DISABLED

The FCC requires that the administering VEs must accommodate an examinee whose physical disabilities require a special examination procedure. To do so, the administering VEs may require a physician's statement indicating the nature of the disability before determining which, if any, special accommodative procedures must be used.

The VEs may accommodate handicapped/disabled examinees by administering the examination at a place convenient and comfortable for the examinee--even at bedside; for the hearing impaired the Morse code may be sent using flashing lights or a vibrating surface; for the visually impaired, VEs may read or write for the examinee; where warranted, the VEs may pause the Morse code message after each sentence/phrase, or each word, or even after each character to allow the examinee additional time to absorb and interpret what was sent--also the VEs may substitute a sending test for a receiving test where the examinee's handicap warrants.

VE Teams may need advanced notice in order to provide the necessary accommodations to examinees who require them. If accommodations are necessary, please contact the VE Team in advance to advise them of your needs.

EXEMPTION OF THE 13/20 WPM MORSE CODE REQUIREMENTS

If you are severely handicapped or disabled individual and have already passed at least a 5 WPM Morse code examination (or hold a license which meets that requirement), you may be eligible for exemption from the 13/20 WPM Morse code examination requirements. For information and applicable forms, send a SASE to the ARRL/VEC, 225 Main St, Newington CT 06111, and request our Handicapped Information Package.

2170. Re: morse code for suns

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-23 19:44:47 UTC
From: zslf08@trc.amoco.com
Message-ID: <1991Aug23.194447.24434@trc.amoco.com>
Source record: 294150

Andrew Siegel's morse program for Suns is a pretty neat hack. Here are some diffs (you can apply them with patch) that add a couple of frills to the program. The first change allows you to set the speed in wpm via the command line option -s. A second change allows for prosigns; if an ampersand & is encountered in the input text, the inter-letter spacing is set to zero until the next space, allowing allowing sequences like &AR, &SK, and so on. If your executable is called /some/bin/morse, then the following script will 'send' the current time out at 35 wpm:

```
#!/bin/sh
echo "time nw `date +%H%M` &ar" | /some/bin/morse -s 35
```

If the above script was called /some/bin/sendtime, then this crontab entry will send the time at 0, 15, 30 and 45 minutes past the hour:

```
0,15,30,45 * * * * /some/bin/sendtime
```

I believe my wpm calculation is correct. If not, someone is sure to set me straight. With the caveat that no guarantees of any kind are extended by me nor by my employer, here are the diffs:

```
50a51,65
> long usec, lspace;
> int wpm = 24;
> extern char *optarg;
> double atof();
>
> while ((c = getopt(argc,argv,"s:")) != -1)

Take a close look at what ICOM does... They have a button on the front that turns-off the pre-amp on the receiver... What ICOM does not tell you in there documentaion is that they measure all receiver specifications except Sensitivity with the pre-amp off... In this way they get better numbers on some receiver items...

I do not hold any ill will towards Kenwood since they measure the receiver with the AIP off (pre-amp on)... I think this is credible...

No flames from here ;-) -- I read your post yesterday and went home to
find a new QST magazine awaiting me. In it was a note about how to
help newcomers get started. I intended to copy it but forgot. The
jist is if you write to the American Radio Relay League (ARRL for short)
in Newington, CT, they will send you a packet of info and a list of
folk in your area that might be able to help you. Newington is small
enough and the ARRL is large enough that that should be sufficient
address.

As for what Amateur Radio is, it's so many things to so many people, it
really is hard to describe. It's people who want to see how many places
they can talk to, others who want to form international friendships,
others that want to tinker with communications electronics, others
that want to help in emergencies. You can use/help develop/experiment
with almost any aspect of radio communications through ham radio, from
very local to very long distance. TV, packet networks, satellite
communications, contests, ...

2173. 10 meter phone procedures.

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-23 20:18:05 UTC
From: JSHCH%ALASKA.BITNET@cornellc.cit.cornell.edu
Message-ID: <9108231921.AA17706@ucsd.edu>
Source record: 294140

JFS@BENO.CSS.GOV (Jim Scheimer) asks about appropriate 10-meter phone etiquette. Like some other respondents, his questions inspired me to climb up on my soapbox.

Jim, you are not alone. As a longtime instructor and Elmer, I've seen many newcomers go through what you so accurately described. It takes a lot more guts to get on a busy band and make a contact than anyone ever would have suspected. I also commend you for your courtesy and gentlemanly behavior on the air, but in this case you need to err more toward Superman rather than Clark Kent.

In your favor....You've got a 5-element beam ('way above average for a novice band station!) and a decent power output. Directional antennas actually help band congestion by confining your signal to a narrower angle of geographical coverage. You can easily command a frequency when the band is open and hold that frequency for a long time. The problem is getting started in a QSO.

One time-honored method is to answer another station's CQ, as you attempted. Another is to find what appears to be a quiet spot on the band and let loose with a CQ of your own, with your antenna beaming toward a likely part of the globe.

Most importantly in this situation, be aware that *no one* is guaranteed a lack of interference on the amateur bands. We all share a limited frequency resource, and you have just as much right to transmit as *anyone* else! If everyone waited for perfectly quiet conditions, no one would ever make a contact under good band conditions! Get in there and compete, and let the chips fall....

After I've tuned around and found what appears to be a quiet frequency, I wait 20-30 seconds, and If I don't hear anything, I go ahead and call CQ. If there is someone lurking there, they'll let me know, and I QSY slightly--maybe 2-3 KHz. up or down, and then try another CQ. Once you get a conversation started, HOLD YOURE GROUND! If asked to move, move 1-2 KHz--if they ask nicely, and you're feeling magnanimous--and keep on talking. Often the other guys will give up and move to get away from you; their radios have dials, too, after all. The whole point is that you will inevitably end up causing some interference, and the flip side is that you must learn to accept interference from other folks. That's just the give-and-take of amateur operation. During a good band opening, it's a free-for-all, and the faint of heart finish last! There's a fine line between being rude and

aggressive, and merely being assertive. Remember, Clark Kent usually got what he wanted, but did it in a nice way.

Thoughts for the future: You already have a strong incentive for upgrading your license class....There's a wilderness area just waiting for you to exploit above 28.5 MHz! Work on your CW down on 40 meters for awhile, and go take a crack at the General Class exam. Do this early and often, because repeated testing reduces exam jitters, and eventually you'll pass!

Things are a bit different for us up here in Alaska...anytime we get on a busy band we're deluged with calls, since we are a DXCC country, and a somewhat rare state for WAS. My point: An unusual prefix makes it easier to crack open the band...take your rig with you on your next vacation!

Good DX and keep trying.

Since I am not a US citizen holding a US ham ticket, I came up with this
question: In general, is the reciprocal license given out based solely on
what country issued the license? Or does the license holder's citizenship
matter too?

Just curious...

From: kevin@noc.hfh.EDU
Message-ID: <9108232034.AA10996@snmpmgr.noc.hfh.edu>
Source record: 294149

Has anybody tried building a dipole for HF using a concept similar to
a spiral microstrip antenna used for microwave?? You know, the kind
where the spiral is etched onto a PC board with the feedpoint at the center.
Is there any major reason why this type of design won't work?? Please let
me know as this could represent a real compact and inconspicuous design. I
believe that the "spiral dipole" arrangement would be effected through
two concentric spirals each a half-wave long.

regards,

2176. NEC (not MININEC) source inquiry

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-23 21:42:00 UTC
From: fletcher@lode.uwyo.EDU
Message-ID: <9108232142.AA29406@ucsd.edu>
Source record: 294144

There have been several articles in various amateur radio magazines the past few months about MININEC front-ends. One article mentioned the generic NEC was meant to run on (a list of larger) systems. The big drawback is the input is apparently rather cumbersome. Nevertheless, I have access to several of the types of computers mentioned and want to give it a shot running full-blown NEC.

Can someone tell me how or where I can get NEC and what is involved in the process?

Send any replies to FLETCHER@LODE.UWYO.EDU

Thanks,
Reid, WB7CJO

>but the 2.5 MHz frequency, I think.

WWV's format is a pain to decode. Try CHU (14670, 7335 and 3330 kHz).

>HEATH (Benton Harbor, MI) has a WWV-sync'ed clock with a digital interface that
>is probably the best bet for what you want. Any general coverage receiver will
>receive the signals.

ARGH!! The GC-1000 is about the poorest excuse for a radio clock
known to man. Try decoding CHU signals. You'll have to deal with
a bit more noise and junk, but the result is you cut out a middleman
and set your computer's clock right to the source rather than to
an intermediate microprocessor.

JSHCH%ALASKA.BITNET@cornellc.cit.cornell.edu (ACAD1A::JSHCH),
in the course of passing on generally helpful advice, says
one thing with which I would take issue:

>After I've tuned around and found what appears to be a quiet
>frequency, I wait 20-30 seconds, and If I don't hear anything, I
>go ahead and call CQ.

On 10m especially, it's very frequent to hear one side of the conversation
only. For example, a person in the next state to yours might be working
someone halfway round the world. If you tune in while the W is talking
(and they do talk for more than 30 secs at a time), calling CQ on top of
him or her is not a nice thing to do, and the DX station may well chew
you out. So I would agree with the above except that instead of calling
CQ I would ask whether the frequency is in use - that would give the DX
station the opportunity to say "yes, go away" or appropriate variation.
In fact, there is no need to wait as long as 20-30 seconds to do this,
if you hear nothing on the frequency in a few seconds, it's either yours
for the asking or else a local (next state, whatever) is using it and
the DX station can tell you that right away.

Otherwise, sound advice!

2179. VFO Interfacing

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-23 22:43:39 UTC
From: edg@netcom.COM
Message-ID: <1991Aug23.224339.24209@netcom.COM>
Source record: 294147

I have a Yaesu FT-301D. It was originally sold with an optional second VFO. I probably have no chance of ever finding one, so I thought I might find a construction article somewhere and try to build a VFO. Some questions occur:

1. The 301D (and 301, I guess) internal VFO produces a signal between 5.0 and 5.5 MHz. Examination of the schematic tells me that the external VFO is switched in at the output of the regular internal one, so I imagine that any stable and clean source of signal that can be varied between 5.0 and 5.5 MHz will do. Am I right?

2. There is no indication of the level of the signal coming out of the VFO. The manual is silent on alignment procedures for the VFO secion of the rig, stating that it requires professional alignment. Thus I have no specs to work from. What sort of level should my external VFO produce? How would I best decide? (The 301 is completely transistorized. -- I assume my VFO must be transistorized too.)

3. It seems that the 301 main display (frequecy counter) will properly display the frequency of whatever VFO is in use. Can somebody who has the rig and both VFO's confirm this? If so, then a display for the external VFO becomes much less important.

4. Can somebody who has the manual for the external VFO provide some specs? I'd gladly pay copying and postage for a copy of it.

5. Am I out of my gourd? Can I actually do this?
-edg

* U2MIR & UW3AX TO VISIT HOUSTON *
==================================
The Texas DX Society, through presidents Jim Lane (N5DC) and Jim Carmody
(NN5O) have announced that Musa Manarov (U2MIR/UV3AM) and Boris Stepanov
(UW3AX) will be guests of the Texas DX Society and will attend the
Houston ham convention on November 9th and 10th. Special thanks go to
Vern "Rip" Riportella, WA2LQQ, for helping to make this visit possible.
For further details, call Jim Carmody after 7PM central time at:
(713) 466-1856.

[Story via NN5O]

* SATELLITE OF THE WEEK *
========================
The "Satellite Of The Week" feature is in response to numerous requests
for amateur satellite transponder passband and beacon frequency information.
All active amateur satellites will be covered in upcoming weeks.

Name : DOVE-OSCAR-17, NASA Catalog Number: 20440, Launched on 22-Feb-90
Orbit : Low-altitude, circular, sun-synchronous, near polar

DOVE-OSCAR-17's primary objective is to provide an easily receivable
satellite signal suitable for educational demonstrations involving young
children. The idea for DOVE (Digital Orbiting Voice Encoder) was originated
by Dr. Junior Torres DeCastro, PY2BJO with financial support from BRAMSAT.

DOVE contains three downlink beacons and no active transponders:

Beacon 1 : 145.824 MHz NBFM Power <= 4 watts
Beacon 2 : 145.825 MHz NBFM Power <= 4 watts
Beacon 3 : 2401.221 MHz 1 watt

The beacons can carry AFSK AX.25 1200 bps amateur packet radio signals, compatible with standard terrestrial VHF packet radio TNCs, providing a downlink for spacecraft telemetry frames and short text messages. The beacons can also carry audio signals using the Telemetry Voice Transmitter Module. The TVTM can transmit either stored voice messages, spoken telemetry, or 1200 bps AFSK telemetry. This module contains a voice synthesizer and a digital-to-analog converter. Voice messages are digitized on the ground and sent up to the spacecraft in the form of packets, which are stored on the OBC RAM disk. The digital speech synthesizer on the spacecraft is based on a VOTRAX SC-02 synthesizer chip.

At the present time, DOVE is being put through extensive tests by ground-station controllers in preparation for full commissioning of the spacecraft. If all goes well, it won't be long before the digital speech capabilities of DOVE-OSCAR-17 are tested and made a part of the regular spacecraft transmissions.

In article <WOLFGANG.91Jul25160444@sam.first.gmd.de>, wolfgang@sam.first.gmd.de (Wolfgang Diestelkamp) writes;

> For at least two or three different ADF's we had a good indication with
> only one thing: the needle pointed directly in the *opposite* direction.
> (and please don't blame me for bad navigation; we were flying along the
> southern cost and had Helsinki as reference).

There are two things that come to mind. First, are you sure that you were receiving *only* the station that you were attempting to use? Low frequency signals can propagate for extremely long distances. Sometimes a more distant station will be received with more signal strength than a less distant station. In that case, the ADF will point at the stronger station. It is imperative that one listen to the station to verify that it *is* the correct station.

The second possibility is that you were receiving some reflected signal, either off of terrain or off of a reflective atmospheric phenomenon. Reflections make direction finding a real pain. We get a fair amount of practice in DF'ing in the Civil Air Patrol. Sometimes one can track a signal for many miles, only to discover that it's just a reflection of a signal coming from a completely different direction. Sometimes terrain or atmospherics can guide a signal along a certain path. This is known as "ducting". It also can make life difficult.

These factors make ADFs less than 100% reliable. They also effect VOR signals though, resulting in course bending and scalloping. They sure make navigation more "interesting".

2183. 1991 ARRL Handbook Errata

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-24 04:37:00 UTC
From: MEHARP01%ULKYVX.BITNET@cunyvm.cuny.edu
Message-ID: <33302EA5A0200154@ulkyvx.bitnet>
Source record: 294169

There is a missing formula in the calculations for an audio bandpass filter in the '91 handbook. This isn't the first mistake i've found either.

On page 28-4, Figure 7. The calculation for R3 in the bandpass filter is missing. Does someone out there know what this formula is? Does the ARRL publish errata sheets for this manual? At $25 a throw, I expect better editing than this.

I appreciate any help. Thanks in advance!

From: abeals@catnip.berkeley.ca.us
Message-ID: <4311@catnip.berkeley.ca.us>
Source record: 294156

bruno@hpldsla.sid.hp.com (Bruno Bienenfeild) writes:

>OOOOUS I made a mistake, the correct freq. is 11.850 kHz, sorry .

Or maybe you didn't.

Radio Moscow is often broadcasting on at least one frequency, if not
two or more, on each of the SW bands at just about any given time.

You may either write them for their schedule [it is *big*, even just
the english-language schedule] or you can get all sorts of nice and
perhaps even accurate schedules from a publication entitled _Monitoring
Times_. This last issue was a little shy in the proofreading on the
articles in the front, so I wouldn't set my alarm clock by the schedules
in the back, but you'll see that Radio Moscow is all over the band at
any given time, if not directing their broadcasts to North America.

Another SWL'er, CB'er turned ham...

You should be able to use either a <break> signal, or three ^C's in
rapid succession followed by a pause. Both work ok on mine.

If you have access to telnet or tn3270, then telnet to
martini.eecs.umich.edu 3000

you can put in a zip code or a city name, and get back a lot of information
including latitude and longitude for the input information..

>
>PM is much easier to use and adjust since it can be applied to several
>stages if required. Almost all modern equipment uses PM.

It's a matter of opinion whether PM is easier to use and adjust than FM.
Detuning the tank circuit of an amplifier that has collector voltage passing
through it is not trivial. Many rigs today *do* use true FM modulation
either in the PLL loop or, as Ramsey does, by modulating the offset crystal
oscillator.

The one thing you can't do with PM is DC shift the carrier. This can be
good or bad depending on what you are trying to do. For most speech work
this is good. For data work it is often fatal. You can generate FSK with
an FM transmitter by simply feeding it the digital data at TTL or lower
levels. Many of the higher speed modem designs have spectral components
at very low frequencies that won't pass through a PM modulator.

Yep. An old command set would be ideal, vacuum state though.

>2. There is no indication of the level of the signal coming out of the

>transistorized. -- I assume my VFO must be transistorized too.)

Since I assume you would capacitively couple the external VFO into
the Yaesu, it doesn't really matter whether the external VFO is
vacuum state or solid state to the radio. As to what level is required,
measure the level the internal VFO uses with an RF probe and meter or
a scope and match that with your external VFO. You *do* already have
a working example of the proper VFO in the radio. The only thing you
have to figure out is how to switch between VFOs.

>video broadcasting, etc? I saw a spot on one of the morning shows
>about people in rural areas who were broadcasting community video,
>sounded real interesting, but, I could never find out how to go about
>setting up a personal studio.

What you need is a LPTV license to do this. These licenses are distributed
to communities by lottery. Currently the lottery window is closed so the
only way to get one is to either find a lottery channel that no one filed
for and apply to the FCC for it, or to find someone who currently holds
a LPTV license and buy it from them. Depending on the channel, you can
run 10 watts on low VHF, 300 watts on high VHF, or 2,000 watts on UHF.
With a good site this can give you a grade A coverage of up to 25 miles.
More likely your coverage will be from 5 to 10 miles. Cost of license
and minimum equipment ranges from as low as $10,000 up to millions.

Of course if you have lots of money, you can apply for a regular broadcast
license providing your communications attorneys and their search firm
can find a vacant allocation that meets the technical requirements in
your community and their filing convinces the FCC to make that channel
available to your community and no competitive filings beat you out for
it and you can show financial responsibility to operate for your license
period. (Not likely in any major metro area) Providing you get a license,
you can run 100,000 watts low VHF, 300,000 watts high VHF, or 5,000,000
watts UHF. With a good site your grade A coverage will extend up to 60
miles or more. Costs start in the low millions and extend into the
hundreds of millions.

Now if all you want to do is play with TV rather than becoming a broadcaster,
you can get a ham license for $5 and a little study. Minimum equipment cost
is under $400. But you can't *broadcast* to the general public. You must be
engaged in two way contact with other amateurs or be transmitting bulletins
of special interest to amateurs.

The absolute cheapest way you can be a broadcaster is to get your local
cable company to air your taped programs on their community access channel.
This is usually free. They may even have a studio you can use.

RTTY DX Notes 1of3 8/23/91
RTTY DX Notes for week ending 23rd August 1991
BID: KT7H235
Part 1 of 3.

It would appear that some people think so much of their computers that
they even believe the computer knows the correct protocol for RTTY.
They never type in carriage return/line feed. I know that some
computers have been told to do this, but others have not, and while
they roll around on your screen they may not be sending the correct
protocol to others, and so at times we get overprints or even line
wipeouts. Check your system for the correct procedure. It could help
others who have poor computers which do not understand what they are
supposed to do without being told. Thank you.

Our thanks this week go to IK5AAX, IK5AWR, I5FLN, K4FJ, OD5NG, TG9VT,
TI2MCL, VK2EG and W2FG and the Tri-State DX Packet Cluster Network.
Again we thank you for your fine efforts and taking the trouble to
send me the notes.

RTTY DX Notes 3of3 8/23/91
RTTY DX Notes for week ending 23rd August 1991
BID: KT7H237
Part 3 of 3.

QSL Information

HG02JP is a special call and commerates the visit of Pope John Paul.
QSL via HA0HG.

4K2OIL says to QSL via UA9MA.

CT3M was used in the contest and requests to QSL via CT3BX.

EN50PQ QSL via UA1ZX.

Notes of Interest.

TI2YP will operate from Cocos Island (TI9) with the call of TI9YO from August 23 to 26. This will be an RTTY only operation. Look around 14095 or 21095 KHz for the signal, and he will be listening 4 KHz up, not on his freq please. QSL direct to TI2SAH, not via the bureau.

Burma. We received a long note from Romeo (3W3RR) who says that the Burma DXPEDITION should start at the end of August, local takeovers and arguments permitting. Hope that they do not intrude in the arrangements, which have had to be changed slightly of late, as you could imagine. The callsign of the expedition will be XY0RR. QSL via Romeo Stepanenko (LZ/3W3RR), Box 812, Sofia 1000, Bulgaria. There will be five operators and three transceivers supplied by Yaesu.

There does not appear to be any further movement from the Albania DXpedition, but keep your fingers crossed.

EN50PQ is a special call for the 50th anniversary of the first marine convoy to arrive in Murmansk from the USA and England in the 1941/1945 last war.

DF3DS/ST is a beaconing mailbox in Khartoum. Considering the situation and conditions there it seems a little strange.

GL DE DX1

The US DOES require that a reciprocal license can ONLY be issued to NON-CITIZENS of the US, so if you have a reciprocal from,say, OZ, then you CANNOT get a reciprocal US license based on the OZ license if you are a US citizen.

2194. hw8/hw9 wanted

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-24 23:20:59 UTC
From: shoppa@erin.caltech.edu
Message-ID: <1991Aug24.223611.19024@cco.caltech.edu>
Source record: 294170

Hi-
My younger brother just got his ticket, and he is successfully
using my HW-100 and HW-101 at home. He wants to operate portable now
(i.e. from a non-moving car), which isn't impossible with these old beasts,
but I think I have a better solution: getting a HW8 or HW9. I had a chance
to use these a long time ago and they were wonderful for their small size.
Would anyone happen to have one of these they are willing to part with?
How much do these rigs usually go for used? I vaguely remember seeing some
at hamfests with asking prices above what they were new :-) !!!

Tim.

2195. WANTED: Anyone selling a used handheld transceiver? Cheap?

Newsgroup: rec.radio.amateur.misc

I'm just now taking the plunge into HAM, and am looking for a decent quality handheld to get my feet wet before jumping into Kenwood desktop territory... Anyone?

2196. Want Reviews of Repeater

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-24 23:48:51 UTC
From: barry@hpdmd48.boi.hp.com
Message-ID: <20950003@hpdmd48.boi.hp.com>
Source record: 294171

I would like to know what experience any of you have had with the
RBC-7000 Repeater Controller from Palomar Telecom. Our club is
thinking of purchasing this controller and would like to know
what you think about it as a user or as a maintainer. I
believe this controller is used on the "Cactus Net" in the
Southwest U.S.A.

Any input via e-mail would be appreciated.

73,

Barry Kurtz

]

1 There are two distinct phases to the bureau procedure:
outgoing and incoming.

2. Incoming is very simple: provide your area bureau with
stamped addressed envelopes of the size they desire with
your callsign in the upper left.
I use 5 x 7-1/2 inch envelopes.
Affix as many units of postage as you desire; when the
envelope is full they mail it. Our bureau asks for a maximum
of five envelopes.

3. Outgoing cards go to ARRL, Newington, along with a payment
of $2 per pound and proof of membership (such as a recent
QST label.) This is for ARRL members only - but if you're
not a member, shame on you; also, the Q-bureau alone will
return the nominal cost of membership.

4. If you want to QSL direct, send your card, a $ or 2 (green
stamps) or a couple IRC's and a self-addressed envelope and
hope for the best. IRC's can be had (in theory) at your
local friendly post office for an exhorbitant price.

5. If you wish, send your cards to the DX bureaux directly; no IRC's etc needed. But the ARRL outgoing does the same thing at far lower cost, so why even think of it.

K3TX

6 Incidentally, I've had best luck getting cards by waiting for the DX station to send me one - occasionally with his IRC! and just answering.

2198. Re: Kenwood TS690s and ADVANCED INTERCEPT POINT (AIP)

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-25 04:45:24 UTC
From: eac@world.std.com
Message-ID: <1991Aug25.044524.17641@world.std.com>
Source record: 294172

In looking over the TS-850 schematic and tracing what I could (very difficult) it seems that one RF amp is used below 22 Mhz, the other above 22 Mhz and that turning the AIP ON removes the RF amplifier from the circuit. Also note that if the jumper by D28 (lower left corner of the RF UNIT schematic) is connected, then the switching point between the two RF amps is changed to 21 MHz.

2199. MAJOR SOLAR FLARE ALERT - X-CLASS - 25 AUGUST

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-25 08:00:20 UTC
From: oler@hg.uleth.CA
Message-ID: <0094DA07.F2127820.27363@hg.uleth.ca>
Source record: 294175

/\

MAJOR SOLAR FLARE ALERT

ISSUED: 07:15 UT, 25 AUGUST

/\

Low to Moderate Impact Possible

MAJOR ENERGETIC EVENT SUMMARY:

A powerful class X2.1/2B tenflare erupted from Region 6805 at 01:15 UT on 25 August. The event was located near the east limb at N22E73. This long-duration flare began at 00:39 UT, peaked at 01:15 UT and ended at 05:16 UT. A second M-class burst began at 05:16 UT, preventing x-rays from falling below the M-class level until 05:40 UT. Optical post-flare loops have been reported with this flare.

A tenflare was associated with this event at 00:36 UT. The duration of the tenflare was an impressive 134 minutes. A major Type IV sweep was observed between 00:49 UT and 02:19 UT (importance 3). A Type II was not reported with this event.

Radio bursts below about 600 MHz were rather weak (below 200 sfu). The 245 MHz burst was measured at only 160 sfu. The peak emission appears to have been at 1415 MHz where measurements of 26,000 sfu were reported at about 01:53 UT. The 10 cm (2695 MHz) emission was measured at 2100 sfu, while the 15400 MHz emission was measured at 3400 sfu. Most of the emissions peaked near 00:50 UT, excluding the large burst at 1415 MHz.

A major HF radio blackout was observed with this event, covering all sunlit sectors with solar zenith angles of less than approximately 60-75 degrees. Blackout conditions were observed over all low and middle latitudes in favorable sunlit sectors between approximately 00:50 UT and 02:20 UT on 25 August. These times are unofficial.

If any amateur HAM or SWL operators (from ELF to UHF) observed this event (or any suspected anomalies), please send a description of the event to the address below with the following information:

- Your Location (latitude/longitude/city/country/callsign)
- Radio Equipment (receiver/transceiver, antenna, etc)
- Observed Time of the Start of the Short Wave Fade (SWF) or other anomaly
- Time of the First Observed Signal(s)
- Time of the First Intelligable Signal(s)
- Time of Full (or Near Full) Signal Recovery

- Indicate the intensity of the SWF. (ex. was a complete
Blackout, Partial Blackout, Moderate SWF, etc, observed?)
- Station(s) and Frequencies Monitored (VERY IMPORTANT)

If any of you observed radio conditions at the time of the major flare, please send your reports to: Oler@Hg.Uleth.CA, or to: COler@Solar.Stanford.Edu. Reports from operators on ALL bands and frequencies (from the ELF to the UHF) are requested. We thank all those who take the time to send reports.

The x-ray data for this event was impressive enough to warrant additional details. We have compiled the x-ray data as follows:

X-ray level at start of flare: C4.7 at 00:39 UT
.. surpasses M1.0 at 00:43
.. surpasses M5.0 at 00:50
.. surpasses X1.0 at 00:56
.. peaks X2.1 at 01:15
.. falls below X1.0 at 01:59
.. falls below M5.0 at 02:31
.. event ends M1.2 at 05:16
X-rays fall below M1.0 at 05:40
X-rays fall below C5.0 at 07:13 UT

This impressive long duration major energetic event had an integrated x-ray flux calculated at 1.02 joules per square meter, which is fairly impressive for a flare of this size.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT:

There is a slight risk for a low to moderate terrestrial impact from this major flare. The threat is not very great due to the poor position of the flare. However, we could intercept an interplanetary disturbance generated by this event which could possibly produce active to minor storm level geomagnetic activity. The threat for storming is not very high. Possible impacts are not expected until at least 27 August.

Region 6805 (which is the return of old Region 6757) is beginning to show signs of increasing complexity and has grown at a moderate pace over the last 24 hours. The activity from this region did not appear to be capable of spawning anything as major this last flare was. Prior to the major flare, only a small subflare had been observed. Todays major energetic event will warrant closer attention to Region 6805.

Should major flaring continue from Region 6805, terrestrial impacts could become an increasingly significant factor. This region will cross the central solar meridian on 30 August and could be a significant threat should flare activity continue. It is too early to say whether this region will be capable of producing major flares this far into the future.

Another major HF blackout is not out of the question until Region 6805 can be further analyzed and observed. At the present time, no other major flares are expected from this region for at least another 24 to 48 hours.

However, M-class flare activity capable of producing minor SWFs is certainly a strong possibility, not only from Region 6805 but from Regions nearing the west limb as well (ex. Region 6781/82 and 6786). Region 6781 is particularly capable of producing M-class flares and possibly an isolated major flare as well. It has retained a magnetic delta configuration in the southern portion of the region.

2200. Re: Vibrators

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-25 12:24:22 UTC
From: gary@ke4zv.uucp
Message-ID: <1991Aug25.122422.18775@ke4zv.uucp>
Source record: 294176

In article <31640003@hpcc01.HP.COM> brooksp@hpcc01.HP.COM (Peter Brooks) writes:
>The concept of a vibrator dates at least back to the Model T Ford.
>The ignition coil used one for the sparking voltage. Don't know
>why they hadn't used points on the distributor.
>
>Pete Brooks

The reason they didn't use points in the distributor is the Model T did
not have a distributor. There was a separate coil for each cylinder.

2201. Re: Discone Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-26 18:14:35 UTC
From: frankb@hpsad.HP.COM
Message-ID: <27890008@hpsad.HP.COM>
Source record: 294108

*Having both a scanner and a 2 meter HT, I want to mount an antenna on
*my roof. What I'm currently thinking about is getting a discone, since
*I mainly scan at home (and use the HT mobile), but I would still want
*to transmit using the discone. Most discones say that they can transmit
*on amateur bands with a VSWR of 1.5:1.
*My question is what kind of gain can I expect (if any) using the discone
*to transmit (say at 2 meters). Does anyone have a discone and could
*comment on its performence. I thinking about using 9913 coax cable
*since I want low loss at VHF and UHF, any comments on coax cable?

I have a Diamond discone antenna. Its 30' above the ground. I use it
for 2 meter, 70 cm, and the scanner. I think its great. The gain is
the same as a quater wave antenna (i.e. 0dB). I have 60 ft of RG-8 foam
cable. The SWR in the 2 meter band is excellent, I don't remember exactly,
but 1.2 or so? The 70 cm band was 1.5 or better. It works quite well from
110-1300 MHz. The whip on top is supposed to make it good for recieving
down to 25 MHz and usable to transmit at 6 meters. The SWR at 54 MHz is
horrible 4:1 or so, there is a narrow dip where the SWR is good from
49-51 MHz. It still recieves ok down there.

2202. Re: CA35 Module ID

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-27 20:55:24 UTC
From: frankb@hpsad.HP.COM
Message-ID: <27890010@hpsad.HP.COM>
Source record: 294109

From: flyn@lselec.UUCP (Francis)
Subject: CA35 Module ID
Organization: ls electronics

*I picked up several modules from our local surplus store that appear to
*be for R.F. use, but I have no information on the parts other than the
*markings on the modules. Any information on the modules, or address of
*the manufacturer, WJ, will be appreciated. A rough picture follows:

WJ: Watkins Johnson Co.

I don't know where you live, so I picked the sales office closest to me:

3333 Hillview Avenue
Palo Alto, CA 94304
(415) 493-4141

Two RF connectors and power, sounds like an amplifier. The 1990-91 catalog
doesn't list a CA35, its probably a special, or its too old. They do have
a WJ-A35 and a SMA35. Both are 10-2000 MHz amplifiers in a TO-8 can.
10 dB gain, +9 dBm out, 1.5:1 in/out SWR, 24 mA at 15 volts.

AMATEUR RADIO EXAMINATION OPPORTUNITIES

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information. Email may be sent to the ARRL/VEC at:

bjahnke%arrlhq.UUCP@uhasun.hartford.edu

You should include your postal address (the slow kind) in case we need to send you non-electronic material in answer to your question.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team are aware that you be attending the test session.

2208. ARRL VEC EXAM SCHEDULE 8/22 - 10/7

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-29 13:36:21 UTC
From: bjahnke%arrlhq.UUCP@uhasun.hartford.edu
Message-ID: <224@arrlhq.UUCP>
Source record: 294099

AMATEUR RADIO EXAMINATION OPPORTUNITIES

The following test session information is provided by the ARRL/VEC for the upcoming six to eight week period. For further information, please contact the test session CONTACT PERSON at the telephone number provided. If necessary, you may contact the ARRL/VEC at 203-666-1541 x282 for additional information. Email may be sent to the ARRL/VEC at:

bjahnke%arrlhq.UUCP@uhasun.hartford.edu

You should include your postal address (the slow kind) in case we need to send you non-electronic material in answer to your question.

Although the test session information presented here does not indicate whether walk-ins are accepted or not, most test sessions do allow walk-ins. We encourage you, however, to always contact the CONTACT PERSON at the telephone number provided so that the VE Team are aware that you be attending the test session.

EXAMINATION OPPORTUNITIES IN YOUR AREA: 8/22/91 to 10/7/91

> Tuning resolution in short wave radios.

I think you will find that 1KHz resolution will not do for SSB, although it will be fine for AM. My Sony 2010 has 100Hz resolution an that is barely adequate. One click/step makes the difference between intelligible signal and squawk on this radio. The 10Hz resolution of my TS-430 ham set makes it easy. If you really want SSB, you had better save your pennies for the more expensive radio.

There is no automatic way to tune a true SSB signal; it can only be done by ear. As you tune across an SSB signal, you first hear it as a low grumble or a high-pitched squeak, depending on the direction you are tuning and whether the set is on lower or upper sideband. The idea is to tune it so that the pitch approximates a normal voice. When you get the pitch right, the voice will suddenly come clear. If it doesn't, you are set for the wrong sideband. It also gets tricky if you don't know if the speaker is a man or woman. Usually you can tell once you get close and can tune accordingly. I still get tripped up sometimes if the speaker has an exceptionally low or high voice. It is really just a matter of practice.

Clear signals!

To the vast numbers of you who have emailed or posted your responses and suggestions--thanks! I've collected them, and am in the process of extracting them for a fairly short FAQ on "Airtiquette" as one respondent described it (HI HI).

But this brings me to my latest foolish venture! I went out and melted the edges off of my VISA card, and bought myself an Alinco DJ-F1. (After all, it isn't always possible to go to the shack). I debated with myself long and hard over whether I wanted to scrape cash together and buy a used radio or suffer somewhat longer term to pay for a new one. . .The advice I got from others ranged from "why buy a new HT when the older ones are just fine" to "why buy outdated equipment without support and a warranty, etc." In the end, it was probably expediency (I've missed all of the local swapmeets and hamfests until November--and by then I'll be back in California), convenience, and the features of the Alinco that sold me. For one thing, it sounds like when I scrape up enough for a TNC, the FM on this radio will do well for the digital modes.

Has anyone else had experience using an HT for packet, particularly the Alinco?

Anyway, I feel a lot more confident about getting on the air--at the advice of several folks, I picked up a copy of the ARRL Operating Manual. It seems to cover just about any question that I might run into for a while, that can't be resolved by just listening.

And for my grand trip across the country coming up, the repeater guide! So, if I don't run into you on 2m as I wend my way through the east, midwest, northwest, and southwest, tnx for your help! Anyone in points between:

Atlanta--D.C.--Ann Arbor, MI--Boulder, CO--Yellowstone--Yosemite--LA

Want to set up a sked for the middle of next month? I'd love to talk to you.

Now, does anyone have any advice how I should best explain this purchase to my Fiance'? It'll be fifteen hours before the battery will be charged up and I can call in reinforcements to my aid. :-)

Re: Collinear backpacking

Some of the marine antennas may offer hints on design. They typically use 5/8 + 1/4 over a groundplane. The problem with ultra-high-gain collinears is that if the donut (er, cookie) becomes too flat, it's more of a hindrance. Perhaps the highest gain/weight ratio can be had with an end-fed extended double Zepp.

I had considered building a collapsible 2-element collinear from the AEA hotrod. Wonder how that would hold together. It's pretty spindly to begin with.

Gee. Maybe I should walk the 100 feet over to your cubicle and talk. :-)

Re: Zero beat

Some manuals (e.g. Kenwood TS440) instruct the user to use USB or LSB and zero beat the incoming CW. The rig is then switched to CW and the the VFO is trimmed for maximum S-meter deflection. On a band with heavy fading, this can be quite a feat.

The problem with 500 Hz CW filters is that it's very easy to miss a CW signal while tuning the VFO. Switching to USB gives you 3 KHz in which to find CW signals.

2216. Re: In response to ICF-SW7600 price and 7601

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-30 10:56:53 UTC
From: caf@omen.COM
Message-ID: <1991Aug30.105653.15699@omen.COM>
Source record: 294083
Cross-posted to: misc.forsale,rec.radio.shortwave,rec.radio.amateur.misc,wi.forsale,uwisc.forsale

The 7601 is in fact an analog radio that isn't terribly sensitive.
One would expect 7601 = 7600 +1 but apparently Sony count differently.

Compared to my supertweeked Sangean SG-796, the Sony is more than
twice as expensive, more than twice as heavy (mostly speaker and
batteries) than the Sangean. The Sony is more selective, but much
less sensitive on whip antenna.

Mr. Chuck whatever : the mail from your site bounces back to me.
First things first : dont post "shit" on the net unless you are sure
about it. Go do your homework. Essentially your posting (s) regarding
the sale of my ICF-SW7600 was a NUISANCE. And someone else posted such
nuisance on misc.forsale only to be called a "scum sucking pig" by the
original poster.
Really I mean, back off, dont post.
As you realize the first lesson you have learnt is that 7601 != 7600 + 1
If you knew anything at all about shortwave radios you would know that
higher the number does not mean better the model. And just for the record
7601 is available for 89 bucks here (not many people buy that crap)

Oh and just for your record a 2010 is far better then 7600 or 7601.
Gee amazes you, 2010 is a smaller number then either of them.

I wish I could write everything I am saying just now on the net.

Atul Kapadia

2218. Thanks for Oz reciprocal license info.

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-30 12:28:33 UTC
From: howitt@arcac.whoi.edu
Message-ID: <1991Aug30.122833.14621@netnews.whoi.edu>
Source record: 294084

I tried e-mailing thanks but some of the messages bounced so :

Many thanks to those who reponded to me about getting a reciprocal ham
license in Australia.
The general consensus was that we could carry the radio into the
country and get the license once we got there. I sent the application anyway
with the application fee AU$30 which cost US$44 and all appropriate copies
of passport, visa, and license. I sent it regular air mail (~US$1.50) and
asked for a quick response on July 29 or so and got it back on Aug. 24 !!!
What a pleasant surprise. Again thanks for all the replies.

We're really looking forward to the trip. :)

2219. vehicle radio grounding/fusing

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-30 14:05:54 UTC
From: vbreault@rinhp825.gmr.com
Message-ID: <62655@rphroy.ph.gmr.com>
Source record: 294086

There seems to be some discussion on the merits and dangers of fusing
the negative lead from an automobile mounted radio.

Please see recent installments of rec.radio.cb for a discussion of
this technique. There are valid reasons for fusing the ground return
but I haven't time right now to reiterate them.

It basically involves cases where the negative lead from the
radio is run directly to the negative terminal of the battery
in an effort to get clean power. There are failure modes that
can cause the radio to be in the auto body ground return path
or even in the starter motor ground return path. In those cases,
a fused negative lead can prevent damage or fire.

BTW - The discussion was relative to noise reduction techniques
in automobile mounted electronic equipment. I think we all agree
that in a higher voltage system (eg 117V) the safety ground or
(in the absence of a safety ground) the neutral should NEVER be fused.

2220. Re: Heath Most Accurate Clock vs WWV

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-30 14:06:22 UTC
From: wmartin@stl-06sima.army.mil
Message-ID: <9108301408.AA29829@ucsd.edu>
Source record: 294087

From: vtserf!groupw.cns.vt.edu@uunet.uu.net
>A friend of mine in one of the labs on campus is having problems with
>his Heathkit Most Accurate Clock. It has not been in hi-spec for
>a while. He called WWV and Heathkit. One of them said that this
>problem is related to the new digital voice and that they are working
>on it. Has anyone else heard anything about this?

This was specifically mentioned on Radio Nederland's "Media Network"
program last night (Thursday 29 Aug). Dave Rosenthal was discussing
the new WWV time-code generation and synthesized voice. Part of the
changeover was that the format of the BCD timecode in the subcarrier
was altered to add more bits. Unfortunately, this had the side effect
of screwing up some existing timecode receivers, which lost lock on the
WWV signal. I would think that the Heath model, being about as low-end
as you can get in this field, would be one of the ones affected.

Wht was not stated was if this particular change and its effect was
publicized adequately beforehand, so that people would have had a chance
to get revisions and/or upgrades ready for their timecode receivers
and be prepared to install or field them at or just after the WWV
transmission change. I get the impression the change had been planned
for a long while but probably not too well publicized in advance in the
right channels.

Message-ID: <9108301419.AA00533@ucsd.edu>
Source record: 294088

Another item mentioned on Media Network in the item about WWV was that the NIST have *finally* issued a revised version of their publication on the WWV/WWVH/other LF stations broadcast formats and the data transmitted. The previous version came out in 1979 and was quite obsolete, no longer agreeing with the actual transmissions.

After I transcribe the address with mail-stop off my tape of the broadcast, I'll post the info here so y'all can write for a copy; it's free.

2223. Realistic DX302: Any good? Market value?

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-30 14:21:19 UTC
From: mwandel@bnr-rsc.UUCP
Message-ID: <5340@bnr-rsc.UUCP>
Source record: 294091
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.misc

I'm in the process of looking for a half decent shortwave receiver. The relative inflexibility of the current consumer-grade digital tuned models has turned me off the idea for the moment. Now someone has offered me a Realistic DX302 that, if the price is right, he just might want to sell. It is an ANALOG radio with a digital frequency display, something which after some thought seems preferable to digital PLL tuners.

Is this radio any good? I have the user manual in front of me, so its features and operation are no mystery, but how does it stack up against the DX440, etc. in terms of stability, sensitivity, selectivity, etc. Am I correct in assuming that being analog, it is more suited to listening to SSB, CW signals etc. What are the radio's main shortcomings? What is a fair secondhand market price for it?

Replies would be MUCH appreciated as this looks like just the sort of radio that I wanted. I do plan to try it out but I lack the SWL experience that allows me to distinguish between a champion and a lemon.

Replies by e-mail as the newsfeed to my site is usually down.

Thanks in advance!

Markus Wandel

Space Center at 08:40 UTC on August 25, 1991. The satellite is
operating normally and was nicknamed 'YURI-3b' (YURI means lily in
Japanese.)

[Story by Yoshiro Yamada @ the Yokohama Science Center, Japan]

* STS-48 NEWS *
===============
Preliminary 2-line Keplerian orbital data for Shuttle mission STS-48 follows:

STS-48
1 00048U 99999 A 91255.95353009 .00023000 00000-0 00000-0 0 00
2 00048 57.0000 234.5800 0000000 000.0000 000.0000 15.00652697 00

With an orbital inclination of 57 degrees, Discovery could be visible over
large areas of the world during this mission. Stay tuned for later Keplerian
orbital data updates as the launch of Discovery and the Upper Atmosphere
Reseach Satellite approaches.

[Orbital data via Bruce Watson, wats@scicom.AlphaCDC.COM]

* SOLAR-A LAUNCHED *
====================
According to ISAS (Institute of Space and Astronautical Science),
The Solar-A spacecraft was launched at 02:30 UTC on August 30
and put to orbit with the following parameters:

perigee 520 km
apogee 770 km
orbital inclination 31.3 deg
period 98 min.

Solar-A was nicknamed 'YOHKOH' (sunlight) after launch.
Equipment installed in the spacecraft is functioning normally.

The following description on Solar-A is based on a fax message
from Y. Ogawa, ISAS:

The Solar-A spacecraft carries instruments for the observation
of solar flares in X- and gamma- radiation. The primary experiments
will make high-resolution images of flares in hard X-rays (15-100 KeV)
and soft X-rays (4-40 angstroms); the former uses Fourier-transform
optics and the latter a grazing-incidence telescope with a "super polish"
finish. The soft X-ray features a 1024 x 1024 virtual-phase CCD as
its image readout device. In addition to these experiments, two other
instruments will observe the soft X-ray emission-line spectrum and
obtain the time series of hard radiations from flares. The Solar-A
scientific instrumentation has a strong international flavor, with
instruments provided by the U.S. and the U.K. As the only solar-flare
satellite in this exceptional maximum of solar activity, we expect that
Solar-A will be the focus of considerable scientific interest.

To accomplish these objectives, a spacecraft with three-axis stabilization
is required. Solar-A will be the first ISAS spacecraft with three-axis
stabilization of sufficient precision for the accurate pointing of high-
resolution telescopes. The requirement on stability rate of 1 arc sec/sec
on short time scales, and 7 arc sec/min to permit long integrations of faint
soft X-ray sources. A magnetic bubble data recorder will permit the
storage of 80 Mb per readout cycle. A combination of telemetry readouts
at the ISAS Kagoshima Space Center and NASA's Deep Space Network will
allow us to dump this data recorder approximately once per orbit (96 minutes),
permitting regular coverage of the evolving solar structures.

[Story by Yoshiro Yamada @ the Yokohama Science Center, Japan]

* SATELLITE OF THE WEEK *
==========
The "Satellite Of The Week" feature is in response to numerous requests
for amateur satellite transponder passband and beacon frequency information.
All active amateur satellites will be covered in upcoming weeks.

Name : WEBERSAT-OSCAR-18, NASA Catalog Number: 20441, Launched on 22-Feb-90
Orbit : Low-altitude, circular, sun-synchronous, near polar

Webersat's primary objective is to register, store, and downlink Earth images
in a format using standard amateur satellite packet radio techniques. WO-18
also has full "PACSAT" store-and-forward capability and these resouces will
be used once the primary mission of CCD image processing is fully satisfied.

WEBERSAT has two downlink beacons and unpublished uplink frequencies:

Uplink frequencies are between 144.300 MHz and 144.500 MHz.

Downlink frequencies: 437.102 MHz (primary, raised cosine BPSK modulation)
437.075 MHz (secondary, BPSK modulation)

The CCD camera carried on WO-18 produces either a standard NTSC analog signal with color burst, or separate RGB signals with horizontal and vertical sync. Pictures are downlinked in compressed form as AX.25 packets. Image display software allows the display of these pictures. The CCD image resolution is 700 pixels x 400 lines. Since a typical picture occupies about 200k bytes of memory, downlinking at 1200 baud takes more than 20 minutes (more than one pass). WO-18 is also able to frequency modulate its downlink beacon with analog video information and in this "turbo mode", can downlink a complete image in as little as 7 seconds.

Webersat also carries a 1265 MHz ATV uplink receiver, a spectrometer experiment, a particle impact detector, and a navigation magnetometer.

* TNX FOR RPTS! *
==========
A special thanks to all those who sent reports to SpaceNews, especially:

How do I get an application form for a Class B licence in the UK ?
I have been given about 4 telephone numbers now none of which lead me to anybody who knows what I am talking about.

Thanks (in anticipation),
Andrew.

2227. FAQ? Minimum tuning resolution for SW receiver

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-30 16:13:55 UTC
From: PJML@ibma.nerc-wallingford.ac.UK
Message-ID: <30.Aug.91.17
Source record: 294098

Markus Wandel wonders about this; well for proper SSB/AMTOR/Packet/RTTY
you gotta be within a few tens of Hz to get it right. Off-tune SSB makes it
hard to tell the gender of the person speaking; (the typically overdriven
amateur SSB transmitters do not help here); off-tune RTTY/Packet/Amtor/SSTV
will be garbage. In the case of Independent Sideband (ISB) as used on many
commercial/marine links, it is generally necessary to re-insert the carrier
at exactly the right frequency *and* phase, or it sounds most odd!
If you want to use synchronous detection and selectable-sideband
reception of broadcast HF AM stations, then you usually have to be able
to tune to within about 50Hz of the carrier frequency before the PLL
will lock properly, but this depends on several factors (PLL timeconstant, loop
bandwidth, bandwidth & shape-factor of the filters).
Receivers that tune in large steps also give a nasty 'staircase' effect
when tuning across the band; i consider a step-size of anything more than
10Hz to give an unpleasant feel to the tuning.
Of course with analog-tuned receivers, the step-size is infinitely small;
since the frequency-spectrum is a continuous resource, the only real way
to tune it is with a continuously-tuned receiver; IMHO step-tuned digital
receivers will always be a compromise.

In article <2196@vtserf.cc.vt.edu> benchoff@groupw.cns.vt.edu (Phil Benchoff) writes:
>his Heathkit Most Accurate Clock. It has not been in hi-spec for
>a while. He called WWV and Heathkit. One of them said that this
>problem is related to the new digital voice and that they are working

Hmmmmm .....

Interesting theory, but I'm not at all sure I buy it. My GC1000
works fine and was just in hi-spec last nite for a while. What I HAVE
observed with mine is that the adjustments for the tone decode are
VERY sensitive, and that the adjustment procedure in the manual is
basically for the birds.

What's probably happening is that one or more of the decode adjustments
is out of spec and/or something is happening to clobber the decode
circuitry. I discovered a couple of things:

1) The decode circuitry is incredibly drifty. When I moved my clock from
a poorly ventilated position (on a crowded shelf) to a better ventilated
position (on a LESS crowded shelf with openings in front and back,
this caused about a 10 deg temp change on the inside of the clock), it
didn't come back into hi-spec until I got in and tweeked the decode
adjustment pots (I don't believe they got jarred in the move, although it's
possible).

2) As I said, the procedure in the manual is for the birds. You need to
get a good counter and set the tone pots with the counter (call Heath or
look in the circuit desc for the ways to do that, I don't have my notes
handy).

3) The tone decode circuitry is also very sensitive to RFI. I have a
battery charger for my ICOM 24AT (the BC72) that puts out a wonderful
noise on 5.000MhZ. When it's running, I can't get the clock within
30 feet, or the clock will NEVER get back in hi-spec.

Hope this helps!

73!

it's possible.

>
> THANKS ALOT!

There are several companies that make small handheld DTMF dailer to use with old rotary phones to access long distance services. As for sizes, they are the size of a cigerate(sp) pack or smaller. I've also seen ones that are address/phone number organizer the size of credit card calculators.

Just stop by Radio Shack, or other dept. stores or fancy consumer electronic stores and see what they have.

If you are looking to build your own, all it should take is a DTMF encoder chip fed into a small speaker and a keypad/switches.

That doesn't mean that they aren't the right ones :-) Best bet is to
call or write to the Radio Soc. of G.B. who will undoubtedly swamp you
with information. I don't have (haven't got) their tel. no. at hand,
but one of the Gs on this net can undoubtedly help with that.

Also, try 0246 217555 - it's the supposed tel. no. of the Radio Amateur
Licensing Unit, who can also be found at:

FC4.4 RALU
Chetwynd House
Chesterfield,
Derbyshire S49 1PF

These are the people to whom I send money annually to keep my G licence
active. I got my old callsign back after nearly 25 years of inactivity,
after dealing with the above people. It also took me about 4 tries at
various addresses before I got the right one. Getting a licence in the
UK is perhaps as much a test of initiative as anything else :-)

I'd like to be able to key my Icom IC-751a from my computer, while still keeping the internal keyer active. I know I could turn off the internal keyer and just use the external interface, but this won't serve in this application. Is there a SAFE way to connect an external keyer output across the output of the built in keyer so I could use either one as the mood or need arises?

I have an application note from General Motors which indicates the
proper way to connect, route and mount mobile radio's in their
vechicles. They stress the need to run ground/power connections
directly to the battery and the need to Fuse both sides near the
battery. The note was dated in March, and I picked it at at the
Dayton Hamfest.

I am having trouble imagining failure paths in the ground causing a
fire.

>the FCC is if he/she is interfering with a commercial communications service.

This is an assumption that is incorrect. While it is true
that FCC has most recently cracked down on folks causing interference
to other services, etc. They are also still quite active in dealing
with problems that our self-policing efforts can't manage. You mention
that the FCC has stated that they want hams to be "self-policing."

This is more a matter of our own traditions over the last 75 years.
More appropriately the FCC appreciates the efforts extended by
amateurs to police themselves via peer pressure thus keeping the
FCC out of the picture if possible.

Back to the point at hand...I know of two instances personally where
the commission was asked to step in cuz the self-policing didn't
work, with the commision being more than willing to step
in as required. These two instances occured within the last two
years. As for when someone can expect to hear from the commission...
just ask the 200 or so fellows who operated out of the U.S.
phone bands during a recent DXpedition operation and got notices
from the commision. The FCC monitoring system is still quite
alive and well.

Certainly the FCC is understaffed, and over-worked(aren't we
all ;-) and they nominally appreciate the help we render
by off-loading some responsiblities (such as license testing)
in the management of our service. But I have not seen any
indication that they (the FCC) are planning on abandoning
responsibility for management of the Amateur service in the
U.S. The facts just don't bare this out.

- = negative leads
+ = positive leads

If the main battery ground strap to the engine fails, (say at X), then there exists a complete circuit from the battery positive terminal, through the starter motor, through the engine to firewall via engine ground strap,

through the body, to the HF rigs mounting bracket, and then back to the battery via the HF rigs negative lead..

Well???? Just a thought

Please escuse the poor art work!

2243. Licensing delay not as bad as feared

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-31 03:39:04 UTC
From: hoffmanmk@stat.appstate.edu
Message-ID: <1991Aug30.233904.1063@stat.appstate.edu>
Source record: 294112

Reecent postings about backlogs at Gettysburg led me to be pessimistic about a quick turn-around for my license but I was pleasantly surprised today.

I took the test at the Atlanta Hamfestival on July 28 under the auspices of the Central Alabama VEC. Got the license today, dated August 27 by FCC

Marvin K. Hoffman

2244. Two-Line Orbital Element Sets

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-31 04:05:53 UTC
From: tkelso@galaxy.afit.af.mil
Message-ID: <tkelso.683611553@galaxy.afit.af.mil>
Source record: 294115

The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity.

Element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space and rec.radio.amateur.misc. This week's elements are provided below.

2245. Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-31 04:06:55 UTC
From: tkelso@galaxy.afit.af.mil
Message-ID: <tkelso.683611615@galaxy.afit.af.mil>
Source record: 294114
Cross-posted to: sci.space,rec.radio.amateur.misc

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space and rec.radio.amateur.misc on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, 2400, 4800, or 9600 bps using 8 data bits, 1 stop bit, no parity. In addition, element sets (updated weekly) and some documentation and software are also available via anonymous ftp from blackbird.afit.af.mil in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a eleven-character name.

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

2246. Potential Geomagnetic Storm Warning - 31 August

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-31 05:42:27 UTC
From: oler@hg.uleth.CA
Message-ID: <0094DEAB.AD618380.803@hg.uleth.ca>
Source record: 294116

/\

POTENTIAL GEOMAGNETIC STORM WARNING

ISSUED: 02:30 UT, 31 AUGUST

/\

ATTENTION:

There is a possibility for the development of a minor geomagnetic storm over the middle latitudes within the next 24 to 48 hours. A well placed coronal hole is beginning to have an effect on geomagnetic activity. Geomagnetic activity has increased to active levels over the last 24 hours. There have been a few episodes of minor storming over the middle latitudes, during the local evening and early morning hours of 29/30 August. Activity over the high latitudes has been slightly more energetic, with more frequent periods of minor storming.

Conditions will deteriorate during the local evening and early morning hours over the middle and high latitude regions. Middle latitudes should observe periods of minor geomagnetic storming, while high latitudes may witness periods of major storming. The overall activity from this disturbance is not expected to be particularly energetic.

Auroral activity has increased over the last 24 hours to mostly moderate levels over the high latitude regions. Activity is visible to the north-central middle latitudes. A minor amount of equatorward expansion of the auroral oval is expected to accompany this disturbance. No low latitude activity is expected to be observed.

A slight amount of degradation in HF signals can be expected, particularly during the local night-time. Middle and high latitude signal paths may suffer from fading and auroral-induced flutter, as well as slightly increased noise levels. Daytime propagation conditions should be near normal over the low and middle latitudes, but may suffer from brief isolated SWFs during periods of minor solar flaring.

** End of Warning **

2247. Re: The voice has changed!

Newsgroup: rec.radio.amateur.misc

In <1991Aug27.102305.20649@rbdc> andy@rbdc (Andy Pitts) writes:

>I don't beleive it, after *all* these years, the voice on WWV has
>changed. The world will never be the same again... (sigh).

I wrote WWV in the 1960's and asked who the guy was that did the announcements. They told me. I think it was Don somebody, I actually still remembered it after 20 years, but now at more closer to 30, I forgot.... Senility I guess.

I found out rather rudely. I had just gotten my rig back from AES repair shop, and first thing I did was hit WWV to check the radio out.

Not only was the nice familiar voice of WWV gone, *BUT* the rig was horribly warbly, AND the reading 30 hz high.

In disgust I boxed it up and sent it back. Mainly since it also had NO AUDIO through the speaker or speaker jack, (only headphones)...

The new voice is not even a PERSON. It is a COMPUTER!

From: N6BVU @ WB6YMH.#SOCA.CA

The following were part of the actions taken by the Federal
Communications Commission during the week of August 12-16, 1991.
++
ON AUGUST 12th....
The FCC issued a 2 page Text on the Amateur Radio Service. Efective
September 30, amended rules Part 97 of the rules governing the
Amateur Radio Service. (See separate posting).
The FCC issued a 4 page Text on the Personal Emergency Locator
Transmitter Service. The Commission dismissed a petition filed by
Kenneth J. Seymour, re: Amendment of Parts 0, 1, 2, and 95 of the
Commission's Rules regarding the establishment of a Personal
Emergency Locator Transmitter Service (PELTS), PR Docket 89-599,
by MO&O [FCC 91-245] adopted July 31 by the Commission.

ON AUGUST 13th....
The FCC issued a News Release about a CB Radio Station Closed;
Equipment Seized by U.S. Government. (See separate posting).

ON AUGUST 14th....
The FCC issued News Release about Term "Severe Handicap" Clarified
For Amateur Radio Service Morse Code Exemption, PR Docket 90-356.
(See separate posting).

ON AUGUST 15th....
The FCC issued a News Release telling that the FCC Orders Florida
Company To Forfeit $2,000 For Selling Radio Frequency Device Not
Certified By The Commission. The Commission has ordered Discount Discs
in Shalimar, FL., to forfeit $2,000 for willfully violating the
Commission's Rules by offering to sell on the telephone, a Sierra
personal computer that had not been certified by the FCC as required
by the rules. J.Mark Brewer, Esq., attorney for Discount, sought
review of the monetary forfeiture penalty. (FCC 91-261).
The FCC issued a 9 page Text On Short-Spacing Rules For Specialized
Mobile Radio Systems. The Commission has amended its rules relating to
short-spacing of stations in the Specialized Mobile Radio Category.
(PR Docket 90-34 by R&O [FCC 91-229] adopted July 19 by the FCC).

2249. Re: Licensing delay not as bad as feared

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-31 13:10:44 UTC
From: jon@turing.acs.virginia.edu
Message-ID: <1991Aug31.131044.20139@murdoch.acc.Virginia.EDU>
Source record: 294119

In article <1991Aug30.233904.1063@stat.appstate.edu> hoffmanmk@stat.appstate.edu writes:
>Reecent postings about backlogs at Gettysburg led me to be pessimistic about
>a quick turn-around for my license but I was pleasantly surprised today.
>
>I took the test at the Atlanta Hamfestival on July 28 under the auspices of
>the Central Alabama VEC. Got the license today, dated August 27 by FCC

I'll bet you took the novice, right? That 610 is sent directly to the FCC,
who has been processing licenses in about 4 weeks regular as clockwork. For
Technician and higher class licenses, the 610 must make it through your
VEC, and then to the FCC. This roughly doubles the processing time, in
my experience.

2252. Restrictive Covenants -HELP-

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-31 20:16:19 UTC
From: tbutterf@ut-emx.uucp
Message-ID: <55047@ut-emx.uucp>
Source record: 294122

This is probably an old topic for many of you, but after a trip to the county courthouse yesterday the Restrictive Covenant story came home to roost at my new house.

Basically, the developer recorded some document that says there can be NO outdoor antennas on any of the lots in the sub-division. There are a pissy group of homeowners in the association who intend to enforce this. I have two questions:

1. I thought Ronald Reagan passed some sort of law that allowed for arials in spite of such restrictions. If this is true can someone tell me the details?

2. The covenants are just a piece of paper that have been recorded at the clerks office. Are these REALLY binding? Can one argue that this is sort of a legislt without representation?? What can the HomeOwners group do to really enforce such restrictions??

I am sure this has hit a lot of you and I'd appreciate any insights you might have picked up along the way...!!

Many Thanks,

Jeff

2253. tesla coil saftey

Newsgroup: rec.radio.amateur.misc
Date: 1991-08-31 21:01:06 UTC
From: bowen@castor.cs.Buffalo.EDU
Message-ID: <1991Aug31.210106.9697@acsu.buffalo.edu>
Source record: 294123
Cross-posted to: sci.physics,rec.radio.amateur.misc

I've just put together my first tesla coil and I'm working up the nerve to turn it on 8-). I've heard of two problems with them that I want to feel more comfortable about before doing anything and I was hoping the people here could offer some suggestions/comments.

The first problem is with the UV given off by the sparks. What number welders glass would be sufficient to fully protect my eyes while observing this thing while it's on?

And the second problem is with rumors I've heard about RF getting thrown back into the wiring resulting in a possible fire from cracks in insulation. I'd like to filter the line but I'm not sure how. Are there off the shelf units for doing this? Radio Shack has a simple 300W filter but it seems to filter from the source to the device instead of the other way around. Is something like this reversable? Any other sources available? Price isn't as much an issue as safety.

Any suggestions appreciated...

Devon

There was a thread on this topic recently in the Hamnet forum on
CompuServe. The information that came out of that which is relevant to
you is:

The FCC pre-empted local legislation regarding outside antennas a
couple of years ago. However, for the FCC pre-emption to work, the
situation must involve a local ordinance and not a covenant in your
deed, with one possible loophole, described below.

A restrictive covenant on your deed is the hardest type of restriction
to work around. When you bought your house, you had the opportunity to
have your title search company look up the records to find all such
restrictions that are on the deed. By buying the house, you implicitly
accepted all the conditions. The only ones that are not valid are
those that violate the Constitution, such as those that discriminate
against race or religions.

Here's the possible loophole as described in a message by KM6FM:

[begin quote]
There was a case in Foster City, CA, where a ham won a suit -
surrounding homeowners had sued because he put up an antenna (a
vertical, as it turns out) in violation of his deed covenants. As I
understand it, the judge ruled that since all (or almost all) of
Foster City (which is a planned community and had antenna restrictions
in almost all deeds, done by the area's developer), the deed covenants
were equivalent to a city ordinance, in violation of PRB-1. The deed
covenants were overturned. The surrounding homeowners have since
appealed - no final decision. [...] I have been told that there has
been a more recent ruling (less favorable to hams) at the Federal
apellate level in California, but have been unable to find any more
information.

Mark KM6FM

[end quote]

Someone mentioned that there might be some info on this in the August
QST.

Source record: 294126

For the life of me, I can't unerstand why nobody has mentioned
CHU in canada. They have a digital timecode that is far
more easily decoded and infinitely more trustworthy than
the NIST trash. Just hook up a Bel 103 modem (I have a design
that uses 3 chips), and you get 9 packets of data containing
day of the year, hour, minute and second. Each packet is
made of 10 300 baud 8N2 serial characters, and the first
5 are the same as the second 5 for checking. The last one
in each second ends precisely at 500 milliseconds past the
second. It's an ideal format for computers. My sun is easily
kept +/- 5 milliseconds, which is twice as good as the Heath's
abomination, never mind the inaccuracy and imprecision of
the Heath serial output.

Yep
]
]Basically, the developer recorded some document that says there can be NO
]outdoor antennas on any of the lots in the sub-division. There are a pissy
]group of homeowners in the association who intend to enforce this. I have
]two questions:
]
]1. I thought Ronald Reagan passed some sort of law that allowed for arials in
]spite of such restrictions. If this is true can someone tell me the details?

No - you are thinking of FCC ruling PRB-1, which affects zoning ordinances
(or did until the 9th Circuit gutted it recently).

]2. The covenants are just a piece of paper that have been recorded at the clerks
]office. Are these REALLY binding? Can one argue that this is sort of a legislt
]without representation?? What can the HomeOwners group do to really enforce
]such restrictions??

Yes, they can be REALLY binding. They are a contract between you and the
subdivision, which you accepted when you bought the property. You DID check
the deed and deed restrictions before you bought, didn't you :-)?

Since it's a (presumably voluntary) contract, you are stuck with it.
There is a possible out: If other neighbors bound by the contract have
violated it and have not been forced to remove the violations, then
a court MIGHT hold that the contract was abandoned.

Another possible out: lawsuits are expensive - your prissy neighbors
have to sue you in civil court, and that takes bucks. Of course, it also
takes bucks to defend yourself. You might be able to bluff them.

If your neighbors really care about the deed restrictions, and have taken
steps to enforce them in other areas, and have not ignored violations
of them, then you had better move out! Also, if you fight the neighbors
on this, there are other ways they can get at you, and none of this
helps ham radio. The other ways they can make your life miserable are:
-harrassment
-complaining to the FCC about imaginary or real TVI/telephone-I problems

Perhaps at some point it will be possible to break these deed restrictions
by showing that the contract was involuntary (ie - you had no choice
but to buy a house with deed restrictions prohibiting antennae). Until
that time comes, these things make zoning restrictions look pretty mild.

I know a person who was sued because he put up a dipole in a neighborhood that prohibits antennae. It cost him $22000 and he had to pull down the dipole (he lost).

I have personal experience with this deed restrictions - My tribander is at 16 feet to avoid neighbor complaints. At my previous house it was at 45 feet.

Good luck.

2257. Gordon West Compares 10m to 20/40m (Sort of re:10m phone procedures)

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-01 04:15:12 UTC
From: dil@mace.cc.purdue.edu
Message-ID: <17700@mentor.cc.purdue.edu>
Source record: 293978

In the June/July "Amateur Radio Communicator", Gordon West (WB6NOA) discusses making demonstrations for classes. He makes a comment on 10m vs. 20m:

"... with 10 meter operators, you'll rarely find someone who won't spend a few minutes with your students and encourage them to jump into ham radio with both feet. [On 20- or 40-meters] there is a 50-percent chance of ending up with an operator on the other end of the circuit that will start bellyaching that we already have enough too many hams as it is; the last thing we need is more hams, or screaming at you because you're within 8 kHz of the old-timers net that has exclusive rights to this spot on the frequency dial."

One could get really depressed thinking that 20/40 (and 80) are populated with idiots like that, 10 is full of the guys who prompted the original post about proper procedure (not to mention the freebanders que no habla ingles), and everything above that is about to be swamped by the no-code heathens, or swallowed up by yet another corporate frequency grab. :-/

2258. Minor Geomagnetic Storm Alert - 01 September

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-01 07:59:54 UTC
From: oler@hg.uleth.CA
Message-ID: <0094DF88.0B95F3A0.1291@hg.uleth.ca>
Source record: 293980

/\

GEOMAGNETIC STORM ALERT

ISSUED: 04:00 UT, 01 SEPTEMBER

/\

ATTENTION:

Geomagnetic activity surpassed the minor storm threshold near 03:00 UT
on 01 September. A minor geomagnetic storm is in progress. It began near
06:00 UT on 31 August. Activity has remained at mostly active to minor storm
levels over the last 24 hours. Some intensification in activity can be
expected over the high latitude regions over the next 24 to 48 hours. Middle
latitudes should continue to observe mostly active to minor storm conditions.

Some degradation in middle latitude HF signals has occurred. Low
latitudes are still near normal and should remain near normal (or possibly
slightly below normal) over the next 24 hours. High and polar latitudes are
suffering the worst degradations, with poor signal propagation conditions.

Auroral activity is mostly moderate over the northerly middle and high
latitude regions. No low latitude auroral activity is anticipated at this
time.

This disturbance should last another 24 to 48 hours. By 03 or 04
September, a return to more dormant activity levels should be observed.

** End of Alert **

The problem occurs when the ground between the battery and the engine block fails. This is reasonably common as the car gets older. The current path is battery, starter, engine, frame, antenna ground, radio, and back to the battery. Either the coax or the ground wire from the radio is going to fail first by melting. Since it may be under the carpet or the dashboard, there is a chance of igniting something else.

Follow that advice to fuse the hot wire near the battery, too. If it's only near the radio, you have some risk of melting that wire if it shorts before the fuse.

>>There seems to be some discussion on the merits and dangers of fusing
--the negative lead from an automobile mounted radio.
--
--Please see recent installments of rec.radio.cb for a discussion of
--this technique. There are valid reasons for fusing the ground return
--but I haven't time right now to reiterate them.
--
--It basically involves cases where the negative lead from the
--radio is run directly to the negative terminal of the battery
--in an effort to get clean power. There are failure modes that
--can cause the radio to be in the auto body ground return path
--or even in the starter motor ground return path. In those cases,
--a fused negative lead can prevent damage or fire.
--
-I have an application note from General Motors which indicates the
-proper way to connect, route and mount mobile radio's in their
-vechicles. They stress the need to run ground/power connections
-directly to the battery and the need to Fuse both sides near the
-battery. The note was dated in March, and I picked it at at the
-Dayton Hamfest.
-
-I am having trouble imagining failure paths in the ground causing a
-fire

What about an open in the lead from the negative side of the battery
to the chassis? If the radio is connected directly across the battery,
the negative battery terminal will now be connected through the negative
radio lead and the radio case/antenna to ground...

>No - you are thinking of FCC ruling PRB-1, which affects zoning ordinances
>(or did until the 9th Circuit gutted it recently).

This is the only thing I wanted to comment about. First off, the
effects of the recent ruling by the 9th Circuit isn't exactly known
yet. The amateur was allowed to keep his antenna but was denied
court costs(which is what he took the thing to appeal for in the
first place) and the city wasn't given any special instructions
in how to apply PRB-1 in the future(this info paraphrased from
a conversation with the amateur litigant..) which is something
the city was specifically after when they counter-sued. My
understanding was that both cases were denied, again this is
from the amateur litigants understanding of what happened.

The bad news is that any state which is served by the 9th circuit
is affected by this ruling. The good news is that these are the
only states affected by the ruling. I've been trying to get a
copy of the ruling so I can really read what the judge said...
so I'm not really sure what the full extent of the damage is.
Rod, KB6ZV, (a local judge and ARRL 2nd V.P.) did tell me
that this was a loss for PRB-1 but he didn't ellaborate on
it. He also explained that as long as the litigation isn't
appealed to the Supreme court that the application of this
ruling is limited to the territory served by the 9th Circuit.
If the suit is referred to the Supreme court AND they refuse
to hear the case THEN the ruling becomes applicable to the
rest of the country.

Be careful of the ionised air created when these things are in operation, especially near mains outlets as I believe that it is not unknown for a "pick-a-back" spark to be set up...ie your mains socket turns into a high current ac arc...the guy who told me about this was actually using a little bench demo Van der Graaf generator but I imagine a Tesla coil could do the same thing...assuming it doesn't simply fry itself first which is the normal behaviour of diy ultra-high-tension generators :-)

Charles Williams.

2265. Low budget ham radio: How?

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-01 19:30:35 UTC
From: mwandel@bnr-rsc.UUCP
Message-ID: <5344@bnr-rsc.UUCP>
Source record: 294063

I see frequent references, here and elsewhere, to getting into ham radio with as little as a $50 investment. But even recognizing that the proverbial $50 would turn out more like $200 in today's dollars, I don't quite see how it can be done.

I've seen a number of construction articles on how to make CW transmitters out of junk bin parts, so I guess that's doable, but what about the other aspects of the station? The power supplies, code key, cabling, supplies to make the antenna, and most importantly, the receiver. I guess most stuff would be homemade, and the receiver would be an antique.

I have a very old shortwave receiver that was professional grade equipment 40 years ago, but lacks such modern features as a CW filter with a passband of 250 Hz, or a frequency display readable to the nearest 10 Hz (10 Khz would be more realistic). Could it be used? Alternately, does anyone use new but inexpensive consumer shortwave radios as their receiver?

What does one do if a tube blows in an ancient piece of equipment? Are replacements available, at reasonable prices?

Is it possible to construct a useable transmitting antenna in the confines of (a) a room in a wood frame house, (b) a highrise apartment, (c) a highrise apartment with balcony? What sort of power could be pumped into such an antenna safely, and what sort of distance could be covered with it?

How does one check out a homemade transmitter, without access to $100K worth of testing equipment? If you take your low-tech CW transmitter and start transmitting in a portion of the band that -seems- free, based on your simple equipment, but end up clobbering someone else's transmissions that you can't hear, what sort of reaction will you likely get? What if you accidentally spill off the edge of the legal band, because your frequency scale is out of calibration? Do they send the goon squad after you?

As you can see, the concept of a really cheap nuts-and-bolts approach to ham radio interests me, but information is scant. Would anyone who operates or used to operate a truly primitive setup care to share their experiences?

Thanks in advance!

Markus Wandel

P.S. Because I am on a very unreliable newsfeed, sending a copy of any really interesting followup posting to me by e-mail would be appreciated. Any path ending in "utzoo!bnr-vpa!bnr-rsc!mwandel" will work.

Hi all,
A few years ago, I wrote to Greenpeace to join their over-wintering operation at Ross Island, McMurdo Sound, in the Antarctic as the communications person. Sadly, that year, they had already got their team together. Anyway, now I'm thiniing about it again.

Has anyone on the net been on one of these teams (or any other expedition to Antarctica?) What problems did you experience? I'd be particularly interested in hearing from those interested in radio who've been down there.

Please e-mail, and I'll summarise if there's a demand. Thanks in advance!

2271. New model ICOM handhelds IC-2SRA & IC-4SRA's

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-02 00:34:01 UTC
From: charlie@mof.govt.nz
Message-ID: <1991Sep2.123401.464@mof.govt.nz>
Source record: 293996

Hello again,
Have you all heard of the new Icom handheld's, there are two
models an IC-2SRA & an IC-4SRA, & they look exactly like a IC-W2A except
they have two antennas. The second antenna is for the wideband receiver
(25Mhz - 950Mhz), & is mounted where the second speaker socket is on the
IC-W2A. The only drawback of these new equipments is they will only
transmit on one band, ie the IC-2SRA will Tx on 2 meters only & the
IC-4SRA will Tx on 70cm's only. The spec's of both handhelds appear to
be the same as the IC-W2A except for the Tx on one band only.
I suppose its logical to expect the next model to be the same
as the IC-W2A plus the above wideband receiver.
This is of interest to me because I want my IC-W2A to be able
to receive down to 70Mhz. If anyone has any thoughts on how this may be
possible please let me know. I have a service manual on order & intend
to pursue this by modifying the low pass & band pass filters before &
after the VHF RF amp. I will keep everyone informed of the results.

Cheers & 73

>

Yes this can make one hell of a mess of a radio. It does depend on the radio having the chassis/mounting-bracket connected to the -ve rail of the power-supply though. I looked in the manuals for all my radios and they all have the -ve rail DC-isolated from the case/mounting-bracket.
So it would require the failure of the battery/chassis earth connection *and* failure of the radio decoupling capacitors (or a short-circuit between the radio's -ve line and the case) to smoke your radio. Me? I ground the radio's -ve lead to the vehicle frame as close to the radio as possible; the resistance of the vehicle tinware is probably lower than that of a piece of no.14 wire from the radio to the -ve terminal of the battery in any case.

>
>Cheers & 73

First... the formula for R3, according to the *1990* Handbook, is:

R3 = 2Q/(WoC)

Guess it's right since it gives the answer shown in the example.

Second... I don't know if this error is corrected in the '92 Handbook
(which has already gone to the printer) or not. I *do* know that
if the editors knew of the error, they fixed it. But unless
someone points out the error to them, they won't catch it in the
next edition. Why? Because they don't re-edit text that isn't
scheduled to be changed, except to fix reported errors. We in the
Lab here at ARRL HQ occasionally find errors in ARRL publications
in the process of answering questions about them. We report them
to the editors, they fix them. But the best mechanism for reporting
these errors is if the readers use the Feedback form that's in the
back of *every* ARRL publication. It's not there to take up space;
the editors genuinely want your comments and, especially, corrections.
About 25% of the Handbook is updated each year. Inevitably, errors
creep in. No one likes that, but we're only human.

Thanks to all who responded...

I drove around the neighborhood today and made a note of others in the 'hood
who do have outdoor antennas. I have found the following:

2 - Television Antennas

1 - CB Vertical Whip

1 - Commercial VHF Whip

2 - Satellite Dishes

1 - "Wireless" Cable system Antenna

Okay, here's the follow-up....obviously the Homeowner's Association hasn't
done anything about these antennas...granted they aren't big and ugly. By
not exercising their options to have these antennas taken down does the Assoc.
give up their right to prohibit antennas??

If they have given up that right, can they argue that the "Whips" are not
the same thing as, say a Yagi????

TX,

Jeff

> portable beam, and am working on revision 2, but there are several reasons
> I want to try a multi-element (3-6 elements) colinear array:
>
Rich Roznoy, ka1of, a friend of mine, gave a talk at a local radio club
called "squash that donut" about building a multi-element colinear out
of 9913 coax. His current designs are optimized for use in a cpvc pipe
but he mentioned today that they will certainly work without such a
covering and can be rolled up for portable use.

Rich handed out some sheets when he gave the talk at the GNARC meeting
(Greater Norwalk Amateur Radio Club) and he and I are both looking for
copies. When we find them I'd be happy to mail them or fax them to those
interested. There are a couple of diagrams which might render the paper
rather difficult for posting here, but I would be willing to rewrite the
thing to circumvent that.

The 'donut', of course, refers to the field-stregth pattern when viewed
from the side. The flatter the better to concentrate the signal at the
horizon and not squander it into the sky....

Unless I am overlooking the obvious...the one common failure mode..eg..when somebody connects their negative lead directly to the battery, and then main battery to frame connections lets go....

Has to assume that the case of the radio is also tied to power return... is this true ? The radio case is suppose to be a faraday (sp?) shield.

If the manufactures are also dumping signal currents into the case (DC distribution...clock returns etc..) then I fault them for that.

Many radios I have opended/worked on, did NOT have the DC return path tied to the case...it is quite common to tie some 1Kv caps to the case, although still violating the purist in shielding design, it is a compromise to lowering the RF common mode return impedance....

Further given the high currents inthe failure mode discussed, and the slowness of FUSES...I dnt think the negaitve fuse is going to save those "tiny little pieces of etch" described in an earlier post.

My vote is as follows (will accept flames) :)

Positive lead to battery. Negative to a close frame point w/ or w/o fusing. I think the common mode return will be lower to the radio, and hence less noise on the power feed to the radio. Also failure mode discussed in other notes would not be valid...as it shouldn't !..ie. no power feed..no problem !

Finally, do you really believe that ur starter is going to crank 300 to 500 amps through that 16 guage wire you connected to the battery :) <<-| Please note..a joke------------|

2284. help on NVIS antenna

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-03 08:09:45 UTC
From: dcruz@folsm3.INTel.COM
Message-ID: <9109030809.AA25221@hermes.intel.com>
Source record: 294005

Hi,

I'm interested in finding articles or information on
NVIS (Near Vertical Incidence Skywave) antenna systems.
These are used to provide reliable mid-range communications at
High Frequency (out to about 300 km distance from the transmitter). The
Soviet Army is using these antennas, as is the US Marine Corps. I'd like
to build one for use at home.

The idea behind NVIS is to radiate a signal vertically, and
use the ionosphere as a spherical reflector. Coverage approaches 100%
up to 300 km from the transmitter. Frequencies used fall between 3 MHz
and 8 MHz, so the 80-meter and 40 meter amateur bands are usable for
this mode. You don't need high power to make it work, either. A 100-
watt transmitter is perfect.

I'd appreciate any help you can extend to me so that I could built
one of these NVIS antenna. Pls let me know if you receive this
message.

thanks & take care, Dave Cruz DCRUZ@FOLSM3.INTEL.COM

2285. RE: Poor Man's Spectrum Analyser

Newsgroup: rec.radio.amateur.misc

From: sid.boyce@amail.amdahl.com
Message-ID: <m0kHX48-0000IzC@juts.ccc.amdahl.com>
Source record: 294006

I was getting the bits together to build this beast, when along came
an idea in RF Design by K2BLA using an MC3356 paging RX IC and a NE602. This
caused a stir in the UK, and several people built it as was, others developed
it further.
The one most widely taken to is by G4PMK ... SIMPLE SPECTRUM ANALYSER
RADCOM Nov. 1989, it covers 1 - 90Mhz, is very sensitive (0.5uv, I think),
includes a 1/10Mhz calibrator.
Cost is UK Pounds 40.74 + postage.
available from.....
BONEX
12 Elder Way, Langley Business Park, Slough, Berks SL3 6EP
Tel. 44 - 753 549502.
This instrument has proved to be very effective and is a good indicator
of band activity as well. I have used it to monitor transmitter output, using
a short antenna via an attenuator and also via an L-Pad Sampler direct (100W).
Homebrew projects and solid state amplifier adjustments are now less of
a hit or miss affair when it comes to spectral purity.
This unit consists of 3 smallish PCB's and is considerably more simple
to build and setup than the Poor Man's.

Message-ID: <16610049@hpqmolm.sqf.hp.com>
Source record: 294039

Lazy way to zero beat the other station:

The only reason for needing precision is to make sure that you're in his passband if he is using a narrow filter. (this assumes that he listens to a band centred on his transmission freq. and isn't working offsets or has left his RIT on :-)

You cannot zero-beat reliably on SSB as your Rx filter has got a lot of attenuation at the carrier frequency, The audio fades out fast before you get close to zero beat. Icom seem to use a free running oscillator for sidetone so this is no true indicator. My 765 also allows me to shift the audio freq that corresponds to my passband centre with a "CW pitch" control (nee BFO) so things are more uncertain still. The Ten-Tec Corsair for example has a "spot" button that cancels the CW offset so that you can do a zero-beat tune, but you are still assuming that the freq shift caused by pressing the button is properly adjusted....

If you fit the narrow CW filter to your rig life becomes much easier. If he is in your passband, you will be in his unless he is using a special very narrow filter. If you listen to a net, you may need to listen round once and fine tune so that all stations fit in your passband. Having slight freq differences on a net speeds up recognition where several stations are running full break-in

Just a bit of practice at planting the centre of your passband on a station will do the job for you. Having a narrow filter helps a lot. Sometimes I just use the narrow filter to tune onto someone, and then go back to the wide filter as I quite like to hear what"s going on nearby.

Thanks for asking this question, I'm planning a very serious home-brew transceiver,and you have caused me to give this area more thought than I might otherwise have given it

Source record: 294007

The Ohio/Penn Dx Packet Cluster
DX Bulletin No. 025 (OPDX.025)
September 2, 1991
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn Packet Cluster Network, WK3N, K4CEF and WD9GGY for the following DX information.

* SPECIAL NOTE * - I am sorry for the size of the bulletin this week. It was all due to a lighting strike in the neighborhood Friday and I lost the use of my computers. Both BARF-80 BBS and my main computer were damaged. Hopefully things will get back to normal in a few weeks. Keep sending your DX info. (TNX KB8NW)

3B7, ST. BRANDON. One of the guys in 4-land spoke with Jacky, 3B8CF, on Wednesday this past week and he said he will be leaving on Saturday, August 31, for 3B7! He said he would be operating and be on the air next week! (KYFC!!)

FW, FUTUNA ISLANDS. FO5IW will be operating from Futuna Islands for a week beginning September 5. His callsign is unknown at this time.

P5, NORTH KOREA. Rumors are circulating that there may be a possible operation from P5 next week. If this is true and legit, the DXCC Country Count will increase by one.

S2, BANGLADESH. It was announced this week that the Bangladesh Telecommunication Board has voted favorably to open up amateur radio in S2-land. This is due to the large part that Jim, VK9NS, kept pushing hard to keep this item on the Bangladesh authority agenda for consideration. Implications here are that licenses could now be issued to foreigners, as well as nationals.

VP8, SOUTH GEORIA. GM4KLO, QSL manager for many "VP8" stations states, "to look for CW activity from that island very soon."

XZ, MYANMAR. XY0RR is up and active. Propagation has been poor and the guys in the northern latitudes are having a tuff go at it. As usual there are the QRM'ers, which do not help things. Romeo and his group have been active mostly on 14020, 14195, 21020 and 21295 kHz. There have been reports from the west coast of activity on 7003 kHz and from Europe on 28495 khz. XY0RR was very active Lador Day morning on 14195 and 14020 kHz and was the loudest any has heard them from 8-land.

ZA, ALBANIA. As reported last, there will be activity from here around September 15th, with well known DX'ers. The well known operator will help the Albania nationals in the fundamentals of amateur radio.

MORE ON THE DX FORUM IN SAGINAW. Ted, K8NA, mentioned the vote for Jarvis Island will be during the week of September 30th. He did not sound too hopeful for this to make it.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

2289. Virginia Beach Hamfest Info. Needed

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-03 12:32:43 UTC
From: tluttrel@homer.msfc.nasa.gov
Message-ID: <tluttrel.683901163@homer>
Source record: 294009

Greetings. I understand the Virginia Beach Hamfest is scheduled for
September 21 & 22. I will be in a school at Wallops Island during the
previous and subsequent weeks, and I'd like to take some time that
weekend to visit the hamfest. Can someone give me some specific directions
to the hamfest from Wallops? Is there a 2m talk-in frequency? What are
the hours of the flea market? Are there any other must see items of
interest in the area that I should visit?
Thanks much,
Terry KE4UR

2290. Motorola Radius on 440 Amateur Band

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-03 12:58:07 UTC
From: ker@cbnewsj.cb.att.com
Message-ID: <1991Sep3.125807.11447@cbnewsj.cb.att.com>
Source record: 294010

Does anyone have a source for the software required to program a
Motorola Radius to work on the 440 Mhz band? Apparently, the
original Motorola software does not allow the Radius to be brought
into the amateur bands.

>morse code at the rate of one letter every two and a half seconds.

I agree that the 'technical wizard' argument was generally grossly
overstated.
>
>Why haven't there been any ecstatic postings about these new additions
>to the ranks? I only know of a few no-code licensees, none of them are
>the technical wizards we wanted to attract, but my sampling is probably
>not a fair one.
I ran a condensed, drink-from-a-fire-hose Technician theory/regs class
here at work and about 8 people ended up getting their Technician
license. They were almost all engineers or technicians. Technical
wizards? --- I don't know.

Other data: the local repeaters have alot of N0O..something callsigns
on them all of the sudden. I can't remember a time when there was
such a noticable surge in new calls.

Jonathan,
Welcome to the hobby. Your story is not unique. I suppose almost
everyone has the jitters when first getting on the air.

One thing that I have noticed about newcomers to almost any hobby
or organization is that they are trying so hard to fit in that they
stand out. Take amateur radio lingo, for example. On 2M FM, you really
don't need Q signals, etc. Just try some plain old English. Many times
its the newcomer trying to show everyone that they have mastered the
language that is overloaded with lingo. "Roger that, old man, fine
business on your QTH and QSY up your QSO, hi, hi."
Do pay attention to legal issues like a proper
identification every ten minutes.

To the not-so-new hams: we need to make sure these folks are welcomed.
If the new folks are ignored (or more likely, just not noticed), they
will develop operating habits on their own. Its real easy for some shy
Tech trying to make a contact on a repeater to go unnoticed for weeks.

[remainder deleted]
These call-sign prefixes (LY = Lithuania, ES = Estonia, YL = Latvia) date from before World War II -- from before the Ribbentrop Pact, in which those three countries were handed to Stalin by the Germans. I'm not sure of my history around the time of the Russian Revolution (1917), but I believe the Ukraine became a part of the USSR then, "then" being before official call-sign prefixes existed. (They were first agreed upon internationally at the Washington Conference of 1927, and officially went into effect on January 1, 1929.) Thus, I *guess* that Ukraine has always had a *U* prefix.

This call-sign-prefix information comes from the second DX countries list published by ARRL in January 1938 *QST*, pages 45 and 46. The Soviet prefixes back then consisted merely of the letter *U* plus a number. European Russia was U1, 3, 4, 7. White Russia, U2. The Ukraine, U5. The Transcaucasian SFSR, U6. Uzbekistan, U8. Asiatic Russia, U9 and 0. I believe that "Asiatic Russia" includes Siberia.

Sidelight: Although the international prefixes went into international official effect as of January 1, 1929, the startup date for their use in the US was moved up to October 1, 1928, so the US government could get an updated call-sign list on press in time to have it "on the streets" by January 1! Whenever you see a reference to a US radio amateur with a *W*-prefixed call sign prior to October 1, 1928, you're reading fiction.

2294. 222 MHz: vertical vs. horizontal

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-03 13:41:04 UTC
From: MROWEN%STLAWU.BITNET@cunyvm.cuny.edu
Message-ID: <9109031408.AA18843@ucsd.edu>
Source record: 294011

September QST carried a short piece in which I recommended that
weak-singal (SSB/CW) operation recently displaced from 220 MHz
to the 222 MHz region should go vertically polarized (rather than
the traditional horizontal polarized).

I have gotten some correspondence on the topic, and have a question for
the Antenna Gurus on the net. One writer told me that, in fact,
vertically polarized signals have a 1-2 dB disadvantage relative to
horizontally polarized signals. This is because, he says, the ground-
reflected wave is preferentially absorbed if it's vertically polarized.
The effect is more pronounced when the ground is imperfectly-conducting.
Consequently, when the direct ray and the ground-reflected ray interact,
a vertially polarized signal has less field strength than a horizontally
polarized signal would have.

So, the question(s):
1. Is this true?
2. Is it true at upper-VHF? [i.e. maybe it's only significant at HF?]
3. If it is true, then WHY is it true? What about vertically polarized
radiation makes it more prone to loss upon reflection from imperfect
ground?

Your responses are appreciated.

>is this true ? The radio case is suppose to be a faraday (sp?) shield.
>
>If the manufactures are also dumping signal currents into the case (DC
>distribution...clock returns etc..) then I fault them for that.

Consider that the coax shield connection is normally tied to the case
and to RF and frame ground. This supplies a path, at least through the
finals back to negative from the frame.

>Further given the high currents inthe failure mode discussed, and the
>slowness of FUSES...I dnt think the negaitve fuse is going to save those
>"tiny little pieces of etch" described in an earlier post.

The fuse doesn't always open in time, but usually at least minimizes the
damage to the circuit board.

>My vote is as follows (will accept flames) :)
>
>Positive lead to battery. Negative to a close frame point w/ or w/o
>fusing. I think the common mode return will be lower to the radio, and
>hence less noise on the power feed to the radio. Also failure mode
>discussed in other notes would not be valid...as it shouldn't !..ie. no
>power feed..no problem !

The reason returning the radio negative lead direct to the battery is
recomended by the manufacturers is that heavy automotive currents through
the frame will raise the negative connection you just made above ground
potential. This will introduce noise modulation into your radio power
system. This is the classic ground loop problem. Avoiding this by going
to a single point negative connection at the battery does raise the
possibility of the failure mode we have been discussing, thus the fuse.

>Finally, do you really believe that ur starter is going to crank 300 to
>500 amps through that 16 guage wire you connected to the battery :) <<-|
> Please note..a joke------------|

You'd be surprised how much current a small wire will carry before it's
vaporized.

2296. Info needed on TM2530A & voice synth

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-03 13:45:59 UTC
From: bobw@col.hp.com
Message-ID: <54420044@col.hp.com>
Source record: 294014

I need to know some detailed trivia about the Kenwood TM-2530A with
the optional voice synthesizer. I want to interface this radio to
a 440 MHz repeater to create a remote base. My question is what
actions cause the voice synthesizer to speak the frequency of operation?
I am hoping to drive the UP/DOWN inputs on the microphone jack to
make the transceiver step through the memories (which will be preprogrammed).
Willl the voice synthesizer respond with the frequency? Is there any
action (such as pushing a special key) that forces the voice synthesizer
to annouce the freq?

Please E-mail any info direct.
Thanks in advance,

Bob KB0CY

The simplest design for what you want is a full wave horizontal loop mounted about 1/8 wavelength above the ground. Feed it with ladder line and a tuner and it works great. If your soil is not highly conductive, running another loop about 5% larger at ground level as a counterpoise will help.

I have heard about a DF system described in the April issue of the RSGB (Radio Society of Great Britain) journal. My local libraries do not carry this journal. Would someone on the net who has this article mind summarizing it via Email to me? I will post the response.

Also, can anyone recommend English language non-American amateur journals that have good technical articles? I would be in subscribing to them.

Thanks.

Heh. Hmm, the article recently posted from someone at Radio Shack mentioned (as I recall) updating the HTX-100 to "HTX-101", but I think the article only discussed the 2 meter rig. Assuming I'm not terminally confused here, does anyone know what the changes are (other than the front panel label)? Did they, for example, add a CW filter so the rig is really useful for CW?

2300. MAXON's Ear Microphone

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-03 15:35:42 UTC
From: <>
Message-ID: <42080001@hpcvra.cv.hp.com.>
Source record: 294018

Probably within the last six months I read an article on MAXON's "ear-microphone" -- theory of operation and some suggested circuits. Does anyone have a reference for me. I have lost the article. Probably in one of the HAM mags but could have been in one of the electronics ones.

Apparently, Maxon sells quite a few of the ear-microphones with the radios attached so someone must be doing something with them. Can anyone comment on their successes and the quality of the voice transmission?

(FYI the ear microphones are $7.00 each or $8.00 with the set of adapter ear pieces -- for those with big ears, I guess. Shipping and handling is $3.00)

|> >Southwest U.S.A.
|>
|> What do you need to know? I have one, I think it is serial number 62,
|> and aside from slow delivery, It's great. But it is not cheap.
This controller is not cheap as Mike says. If you are looking for a
controller for a simple repeater then you should look at the ACC-85 or
the CAT-500. The CAT-500 is very limited, but will do a good job for a
simple repeater!

|> The RBC works with everything from a 1959 Motorola BBY (our first
|> repeater), to Prog Line, Micors, Master-Pros, Icoms, etc. The only problem
|> that I am aware of is that an Icom 1200 repeater could not handle the
|> 47k input impedance of the audio port and required a FET buffer amp.

|> M6709 Micor squelch chips, or the General instrument AY-3-8913 tone
|> generator chips or the S3526 tone filters. Even those are in stock
|> at Palomar, and can be FedExed should you have a major disaster (like
|> a direct lightning hit).
Although lightning is not a big problem here in California, the ACC
controllers give a very good warranty which INCLUDES lightning! I have
looked at there design and it seems that they have placed filters on the
phone card, etc that should solve this problem...

|> We have some special software in ours, with a grunge filter on the
|> receiver COS, and dual repeat (we run 440 and 6m repeaters side by side,
|> with the ability to run them seperate or joined) but other than that

|> it's a dead stock 4-port device.
I have heard that the Palomar controller has everything is PROM. So if something needs to change you need to get new PROMS. Not sure if this is true. I do know the ACC controllers have EVERYTHING in E2PROM and that anything can be programmed to whatever you need!

|> The speech synthesizer card sounds like a hi-fi tape recorder. In fact
|> it is also a seperate product. Custom words are available at no charge.
|> It is based on the OKI chipset, with its own PROM on the card. If you
|> want to have your system say "Looking down from five thousand feet on
|> Mount Lukens, this is the WA6ZRB repeater", no problem (but please
|> don't, our trustee would get upset). The standard voice is the owners
|> wife, who sounds excellent. He can also record from your tape if you
|> want a special voice.
Does this card prvide a vocabulary or does is just give you a set of canned messages that you can access. The ACC controller uses the TI chip that gives a vocabulary and you can build up a message... Sure is sounds computer generated, but it is very good for telemetry and everything is perfectly understandable.

|> If you know what to listen for (and _when_) you can recognize the sound
|> of these controllers (no, it's not a dead giveaway like the ACC
triple beep).
Don't get the wrong idea here... The ACC triple beep in the courtesy tone can be programmed to be anything from a morse character, a voice message, a single tone (frequency/durartion/hang time your choice) or up to three tones (again freq/duration/hang time your choice). I think what Mike is trying to say here is that every repeater controller has a specific feel to it.

|> With my scanner here I have found 24 RBC-based systems.
I only know of a few repeaters in the Bay Area that are Palomar based. I think most are ACC based!

|>
|> I know that this sounds like an advertisement, but just to allay fears,
|> I have no financial interest in Palomar Telecom, nor am I on the
|> payroll.
I am also not affiliated with ACC... I just think they have some very good products!

As a couple of side notes....

I had looked at the Palomar controller before getting the ACC 850, but when I asked for information on there controller and I did not get it for 6 weeks I gave up on them (I called 3 or 4 times!). I became worried that they would not be able to support there product. ACC has always had excelent phone support and they were able to answer all of my questions right away....

I also think the power requirements of the Palomar controller is very high. I think I read that the basic system is about 5 to 6 AMPs....

With that much power in that card cage I would think a fan would be needed to keep it cool!
As you may know the ACC controller has a very low power requirement of about 200 ma (fully loaded).

I have been running my 1.2 GHz repeater for over 6 months now and the ACC controller is fantastic.

The subject pretty much sums it up, I'm looking for some R-390A parts, specifically the Line Level and Carrier Level meters. I just bought a working unit in which these were missing! I am also in need of one of the small knobs, the one for the Line Level meter switch. I'd be interested in whole carcasses or just the parts mentioned.

Please e-mail or call me if you have any R-390 parts on hand.

Also, If anyone has a manual for the R-388/URR I could use one of those too (wishful thinking, i know :-)

Thanks,

/\

SOLAR TERRESTRIAL BULLETIN

03 September, 1991

Call for Comments regarding a
Proposed New Service

/\

CALL FOR COMMENTS:

We are requesting input from all interested persons regarding a new service we are proposing to institute.

We would like to know how many of you would be in favor of a daily broadcast of solar geophysical indices. The information would be short and to the point, containing the following information:

- 10.7 cm solar radio flux from the Penticton Radio Observatory.
- Sunspot Number from the SESC at NOAA.
- 00 UT Boulder A-Index value.
- 8 three-hourly K-Index values as reported for Boulder.
- Estimated 8 three-hourly Planetary K-index values.
- Proton Fluence at greater than 1 MeV and 10 MeV.
- Background X-ray flux.
- List of all active warnings.
- List of all active alerts.

The data would be arranged into a brief message with no textual descriptions of other phenomena. This would be a DAILY broadcast over the nets.

If you would like to see (or would not like to see) this new service implemented publically over the nets, please send your comment(s) to: Oler@Hg.Uleth.CA, or to: COler@Solar.Stanford.Edu.

We will base our decision heavily on the comments we receive.

Time do dig out the physics books.. it's certainly true that visible
light reflected off the ground is horizontally polarized (that's the
basis for poloroid sunglasses), and as I recall, that is a general
trend for waves reflecting off surfaces. I don't know for sure how
that applies to 220 mhz and garden variety (:-) dirt.

The article also said that increased interference from 220 fm would
only be a problem in the rare case where you are trying to copy weak
signals while operating near a repeater or some such.... like say
contesting on a mountain top? most mountains with electricity will
already have vertical fm antennas galore.

In rec.radio.amateur.misc, MROWEN%STLAWU.BITNET@cunyvm.cuny.edu (Mike Owen W9IP) writes:

>September QST carried a short piece in which I recommended that
>weak-singal (SSB/CW) operation recently displaced from 220 MHz
>to the 222 MHz region should go vertically polarized (rather than
>the traditional horizontal polarized).

I have always heard that horizontal polarization is better for VHF
DX'ing than vertical. Over long paths, the polarization tends to
become "scrambled", and ends up mostly horizontal at the far end
of the circuit, even if the transmitting antenna is vertical.

I have never heard a theoretical justification for this, but it
supposedly is based on extensive testing many years ago by Ed Tilton
W1HDQ and others.

Message-ID: <11671@pitt.UUCP>
Source record: 294026

In article <1991Sep3.125807.11447@cbnewsj.cb.att.com> ker@cbnewsj.cb.att.com (kenneth.roser) writes:
>Does anyone have a source for the software required to program a
>Motorola Radius to work on the 440 Mhz band? Apparently, the
>original Motorola software does not allow the Radius to be brought
>into the amateur bands.

The regular Radius programming software can do it, but there is a special procedure. Your Motorola service rep should be able to provide this to you. It involves calculating the programming values in hex and entering them using the hex debugger that is part of the original Motorola software.

2310. Penny feed details needed.

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-03 20:46:12 UTC
From: andyw@aspen32.cray.com
Message-ID: <1991Sep3.154612.26784@hemlock.cray.com>
Source record: 294030

I'm trying to build a 10Ghz antenna, I have a parabolic dish
(f/D ~= 0.45), and some waveguide (0.9" x 0.4" - WG16). I
believe that a penny feed would be the simplest way for me to
illuminate the dish, but I can't find design details anywhere.
I've checked the VHF/UHF manual and the ARRL handbook.

I'm looking for design details (disc size, slot size & placement),
hints on how to cut a good "penny" (without the machine-shop-in-
your-basement that the VHF/UHF manual expects !) and ideas
on how to seal the slots against bugs & the elements; or
references to any of the above.

Thanks in advance, I'll summarize if there's enough interest.

2311. DXCC Country List

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-03 20:47:20 UTC
From: wmb@ulysses.att.com
Message-ID: <15423@ulysses.att.com>
Source record: 294029

The current ARRL DXCC country list follows. Changes from the
previous posting (11/90) include the addition of Penguin Islands
(ZS1) and North Korea (P5; effective with the first accredited
operation), and other minor modifications.

Much of the information was provided by Ron McConnell, W2IOL.

The colon-separated fields are:

1. primary amateur prefix ("*" suffix for deleted countries)
2. country name
3. continent
4. ITU zone(s)
5. CQ zone(s)
6. time zone (hours from UTC)
7. latitude
8. longitude
9. ITU prefix allocation(s)
10. other amateur prefixes

Please mail corrections and suggestions to me.

2312. Re: vehicle radio grounding/fusing

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-03 20:47:26 UTC
From: brian@ucsd.Edu
Message-ID: <40757@ucsd.Edu>
Source record: 294032

Most car batteries are grounded by a fat negative lead to the engine block, since that is the return path for the starter motor. Many have a second grounding lead that it screwed to the frame near the battery.

Running the radio hot lead from the battery is not a good idea, as it experiences a lot of corrosion. I have always preferred to grab the heavy A+ from the starter solenoid, since it's just as good a feed as the battery + post (being only about a meter of very heavy wire away) and that terminal is far enough from the battery to avoid getting acid mist on the wire.

Probably picking up the negative voltage at the corresponding place (where the heavy negative lead is bolted to the engine block) is a smart thing to do.
- Brian

2313. Re: MAXON's Ear Microphone

Message-ID: <2554@atlas.tegra.COM>
Source record: 294037

In article <42080001@hpcvra.cv.hp.com.> gregm@hpcvra.cv.hp.com. (Greg May) writes:

Probably within the last six months I read an article on MAXON's
"ear-microphone" -- theory of operation and some suggested
circuits. Does anyone have a reference for me. I have lost the
article. Probably in one of the HAM mags but could have been in
one of the electronics ones.

Apparently, Maxon sells quite a few of the ear-microphones
with the radios attached so someone must be doing something
with them. Can anyone comment on their successes and the
quality of the voice transmission?

My housemate bought a set for Rally intercoms between driver and
co-driver. Seems kind of silly to me since they are sitting next to
each other but I guess they are happy with the results and the price
is less than the intercom sets they could buy.

Speaking of intercoms, has anyone built a helmet intercom set before?
I am designing one now that would allow two helmets to converse, run on
12 volts, and interface one or both microphones to a Icom vox unit.

The article on the Maxon intraural mike was in November QST. When I called Maxon to order one, the lady asked, "Are you a ham?" I said, "Yes, how did you know that." She said the only people who used the term "intraural" (which the Maxon people had never heard of) were hams who had read some article about them and were all calling orders in.

This is very weird. I just read the last few articles here and one of them is simply an announcement about a no-code license that the FCC just approved. I thought that was a year ago. The next article told me that at the time of going to press, Walter Cronkite was about to take his novice test - while the on-line callbook says he did that in 1988.

These messages must have been floating around in space for several years and just made it here. Is this some side-effect of the recent solar storms? Or am I picking up reflections from outside the solar system, of radio transmissions sent out in the last decade?

The articles just made it here to this site, too.

Remember the Long Delayed Echos that O. G. "Mike" Villard wrote about
in QST in the '50s or '60s? Yep.

1991-1988 = 3. Hmmm, no stars 1.5 light years from here, unfortunately.

This is an EME experiment. The "M" in question, however, is the fourth moon
of the planet Zrokthyzz, a relatively minor satellite of Alpha Centauri.

I just succumbed to the desire for a Multimode Data Controller, specfically an AEA PK-232. Aside from getting onto packet, I'm hoping to enjoy using it with my general coverage receiver to copy RTTY and AMTOR transmissions, such as news, weather, whatever. I understand that most stuff is encrypted nowadays, and indeed most RTTY signals I find come up as garbage, except in the ham bands, of course. I have heard that there are some govt. news services and the like that are still sent in the clear. I'd appreciate hearing of times and frequencies of any sort of clear transmissions, especially those I'm likely to be able to copy here in the Pacific Northwest. I'd also like to hear about any CW utilities that are at all interesting. Thanks in advance and 73!

the following article crossposted from ham radio packet:

From: n2irz@kd6th.nj.usa.na (Don)
Message-ID: <60957_KD6TH>
To: fyi@njnet

There are basically only two common types of rechargable batteries: Nickel-Cadmium cells (NiCads) and Lead-Acid cells. Nicads are usually small, as it becomes difficult to manufacture high capacity NiCad cells. Lead-Acid cells are usually used for large-power applications, such as starting a car. A special type of Lead-Acid cell uses an acid that has been gelled, kind of like soft jello - the Gel Cell.

Regular Lead-Acid batteries use diluted Sulphuric acid as an electrolyte, in liquid form. Unfortunately, the fluid can leak out, even in so-called "sealed" batteries, creating a dangerous situation. In a Gel Cell, the acid is too viscous to leak out, even if you break the battery open, increasing safety near people. This makes Gel Cells the battery of choice for battery-backed power applications. They do, however, require different care from other types of batteries.

Gel Cells are severely damaged by deep cycling, when you discharge a battery completely (or nearly so) and then recharge it. Leaving it in a discharged state, even for a week, also damages the battery. Owing to different chemical reactions, this type of treatment is actually good for NiCad cells - but fatal to Lead-Acid cells. Gel Cells are not easily repaired when they are abused, also unlike NiCads. (Too much abuse will kill ANY cell). The best conditions for a Gel Cell are a constant trickle charge, with brief periods of moderate discharge - typical battery backup requirements. Overcharging, even a little, kills any Lead-Acid cell, but is especially harmful to Gel Cells since the electrolyte (acid) cannot move around freely, and critical areas can become devoid of the essential Sulphur ions.

A normal Lead-Acid battery has an open circuit voltage of 2.3 volts, with a 6-cell, "12" volt battery delivering about 13.8 volts. The trick to keeping the battery charged without disastrous overcharging is to only charge to about the 90% level. In real terms, that means a slow charge at about 10% of the Amp-Hour (Ah) rating. Thus, if you have a 25 Ah battery, you should design a circuit that doesn't provide more than 2.5 Amps. That will get the battery charged up fast enough, but as current drops, the voltage will probably rise. The charger will become self-limiting if you also make sure that the voltage never rises above 13.8 volts !

Now, I can see hundreds of battery cogniscenti reeling in horror at that last statement. Sure, for a full charge, the voltage must end up at about 14.4 volts - but we only want 90%, thus permitting us to leave the supply connected without damaging the battery by overcharging ! There are automatic battery chargers available, at reasonable cost, that will bring you to 100% but not 101%, and they're great. But a cheap ham (like me) can get away with an old cube-type power supply, rescued from a calculator. And 90% will keep the batteries happy while providing enough power.

Batteries are rated by voltage (nominal 2 volts per cell) and capacity in Amp-Hours (Amps times Hours). Since the capacity of the battery is directly related to the discharge rate (as a percentage of the maximum rate), most Ah ratings are for a 20 hour period. Thus, a 20 Ah battery can provide 1 Amp for 20 Hours. I doubt, however, that it could provide 20 Amps for 1 Hour.

To select the capacity you need for your system, just multiply the average current draw by the number of hours you expect your system to operate without utility company power. Take that number, and multiply by 3, so you only discharge your batteries by 1/3 (to 60%) at most. If you run something that may be used more heavily in an emergency without power (like a repeater), figure that into your average current rating. Better, of course, would be more battery capacity - like twice the number you just got. Not only will the batteries last much longer (due to the shallower discharge cycle), but in a REAL emergency, you'll be on the air more than twice as long. By then, if your equipment is that needed, someone will have connected a portable generator. After all, 24 hours is stretching any battery backup system.

These suggestions will also work for liquid-electrolyte batteries, like car batteries, but some extra precautions are required: Batteries generate highly explosive Hydrogen gas (remember the Hindenberg ?) and must be ventilated and kept away from ALL sources of ignition (like that cigarette, OM). Near people, take care that the acid can't be touched or spilled. Also, check the water regularly, even in those "sealed" batteries, because low water is a battery's worst enemy (check your car, too). The ideal solution is to locate liquid electrolyte batteries outside, in a ventilated box that is kept warmer than -18C (0 F). A charged battery won't freeze, but a discharged one will. As a second choice, keep it indoors, but put the battery in an enclosure that is vented, with a small fan at least 2 CFM, to outdoors.

A battery backup system with Gel Cells is simple, safe, and reliable. Keeping them charged is easy, if you're willing to compromise a little. The batteries are not inexpensive, but don't be fooled into buying used ones: they've probably been killed by sitting uncharged for a year in someone's basement. For more information, go to your library and ask the librarian, who will be happy to help. A engineering university library will have more of the theoretical stuff, and the ARRL Handbook has a few pages on the subject worth reading.

Source record: 294036

Could someone tell me, with regard to the BC760XLT, if the CTCSS tone option is programmable for every channel? For instance, if I purchase the unit, and get the CTCSS option, can I program a different CTCSS tone for EVERY channel?

Or, can there only be 1 tone active at a time?

Yes, the CTCSS option is programmable for every channel.
When you program a frequency, you are then prompted for a tone.
If you don't want to program a tone for a specific channel, you can enter
0, or just go on to the next channel.

The tone option is the main reason that i bought the bc-760xlt. Here in the
intermod prone SF Bay area, it makes the difference.

> radiation makes it more prone to loss upon reflection from imperfect
> ground?

Yes, "ground gain" is greater for horizontally polarized signals than for vertically polarized signals. Why? Because the ground is horizontal. (In most areas anyway) The cross polarization for vertical signals can cost up to 30 db. Since ground gain can add at most 3 db to your signal, a 30 db drop in the adding signal will just about negate any advantage to be gained from the ground reflection. A second problem with vertical polarization is more multipath. Why? Because most good re-radiators are vertically oriented. (metal light poles, high rise buildings, towers, water tanks, etc) We needn't even mention the extra noise pickup of verticals.

From: swood@vela.acs.oakland.edu
Message-ID: <9563@vela.acs.oakland.edu>
Source record: 294049

I am trying to see if there is any interest on the network for
the new Radio Shack HT's. They are due to hit the stores real soon, and
I want to see about getting myself one. I was thinking of getting a
group of people together, and getting enough of them to get a group
discount on them. I would essentially sell them as is, but would be
willing to try to help anyone get an exchange if something went wronge
within the standard warranty period (should be 90 days)

If I get enough people interested, I should be able to get them
at a price of $235 + $5 for Shipping. If you consider that the new price
is $259.95 ($270.35 with tax) that should be a pretty good deal. If anyone
is interested, I suggest that you get to Radio Shack and check them out and
then let me know. I hope to get at least a dozen people so I can get the
best discount...

> the parts mentioned.
>
It has been explained to me that the reason these receivers have no meters is that the scales were painted with radium based paint to aid in night viewing. The associated health impact of such exposure is well documented and should be cause for concern. So, that argument seems logical and well justified. But, hey, I'm no doctor and this is all second hand. I can not substantiate this assertion with fact. If anyone out there knows about this I would greatly appreciate a posting to info-hams.

In regard to your request: have you tried Fair Radio Sales, Lima, OH, (419) 227-6573. You might also try: W2FNT, JOHN A KAKSTYS, 18 HILLCREST TER, LINDEN, NJ 07036. I completely "re-tubed" my R-390 thanx to him. He may have a cannibalized set or even the knob you're seeking.

There was a recent posting to info-hams (Aug 15) of an extensive list of "Mail Order Electronics" companies that contained quite a few Surplus houses it was posetd by ksr!jfw%ksr.com@uunet.uu.net. BTW, I have no connection with Fair Radio or W2FNT, commercial or otherwise.

>
>One net Elmer suggested that I look in my manuals to see if the
>cw sidetone pitch control also changes the cw offset frequency.
>If it does, then the above technique is valid. If not.......

Only considerably more expensive radios include circuit that
changes the CW offset *and sidetone* simultaneously. I don't
think the IC-735 allows adjustment of its sidetone pitch;
what control there is sets the sidetone volume relative to the
strength of received-signal audio. As your correspondents have said,
tuning the IC-735 until received signals come in at the sidetone
pitch puts your transmitter at or very close to the incoming signal
frequency. You can see how closely the sidetone matches the IC-735's
actual offset like this:

1) Set the IC-735's mode to CW and attach an antenna so you can receive
signals. Attach a key so you can key the radio for CW.

2) Starting at 19.999.9, 14.999.9, 9.999.9, 4.999.9 or 2.499.9 MHz (the
higher the better), tune up to WWV or WWVH until *exactly* the point at
which the radio's display rolls over to 20.000.0, 15.000.0, 10.000.0,
5.000.0 or 2.500.0 MHz. You'll hear WWV's carrier as a key-down CW
signal at a pitch equal to the IC-735's actual CW offset.

3) *Being sure the radio cannot emit a signal*, press your key to hear
the radio's sidetone and the WWV carrier simultaneously. The frequency
difference between them is the error between closely the IC-735's sidetone
pitch and CW offset. You may hear an error of a few tens of hertz; that's
okay. (The IC-735 service manual probably lists the tolerable error.)

Have fun, and 73.

Source record: 294056

Bill,

You may be interested to know that as of the 25th July, the UK has started using the "2" series of callsigns for the new UK Novice license.

The prefices are as follows;

Country	'A'	'B'
England	2E0	2E1
Wales	2W0	2W1
Scotland	2M0	2M1
I. of Man	2D0	22D1
Jersey	2J0	2J1
Guernsey	2U0	2U1
N. Ireland	2I0	2I1

The 'A' licensees have passed a 5wpm Morse test, and are likely to be heard on HF, the 'B' licencees have not passed a Morse test, and are therefore likely to heard only on VHF. They are all likely to be using QRP, so listen hard, and *No*, they're not pirates.

73,

Hugh, G0CNR

I understand that the new WWV and WWVH voices emanate from a new time-
code generator, the upgrade of which has also entailed changes to the BCD
word transmitted at 100 Hz beneath the voice modulation. Result: Some or
all field hardware set up to decode and use that BCD information can't
handle it.

2338. Bearcat 100 repair info needed

Newsgroup: rec.radio.amateur.misc
Date: 1991-09-04 14:57:34 UTC
From: Hugh_Wells.El_Segundo@xerox.com
Message-ID: <".4-Sep-91..7:57:34.PDT".*.Hugh_E._Wells.El_Segundo@Xerox.com>
Source record: 294058

I have an old Bearcat 100 scanner (including the schematic diagram) which has recently developed a problem that I would like to repair, but need some assistance.

Electrical problem:
Upon turn-on, the red battery low indicator comes on and the radio hisses continuously regardless of squelch control position. After a time, perhaps 20 minutes, the red LED goes out but the radio still hisses. There was a time when the hiss would also stop and the radio would operate normally until turned off and back on again. It would then repeat the above condition. The radio does not hear stations during the hissing condition as if the frontend is locked out even though the display indicates a channel.

New and fresh batteries have been installed and the battery voltage remains above 7.2 volts. The radio operated properly for years until one morning when it started the above listed problem which now persists continuously.

Mechanical problem:
How does one go about removing the radio from the two metal side rails? I have been successful in removing the back and did managed to lift the top potentiometer panel, but can not remove any more without finding out the secret combination for removing the board.

Comments regarding taking the radio apart and a component fix would be appreciated.

Thanks and 73,

Hugh Wells, W6WTU

Checking, I found that the article by Albert Helfrick, K2BLA, is in the
January 1988 issue of RF Design. I haven't gotten a copy yet.

> The one most widely taken to is by G4PMK ... SIMPLE SPECTRUM ANALYSER
> RADCOM Nov. 1989, it covers 1 - 90Mhz, is very sensitive (0.5uv, I think),

> Tel. 44 - 753 549502.

Sid also responded to some email of mine about this, and cross-posted
it to rec.radio.amateur.misc as well. Since I haven't seen it here,
I'm going to violate nettiquette a bit here and post his response
here, because I assume his posting got munged on the way:

> ****** JUST A FEW MORE NOTES TO THOSE FURTHER INTERESTED *****
> Yes, the company is in Berkshire. Radcom (Radio Communication) is the
